INFRASTRUCTURE CONDITIONS ASSESSMENT
AMERICA'S CENTRAL PORT
MADISON, VENICE, AND GRANITE CITY, ILLINOIS

1.0 INTRODUCTION AND PROJECT DESCRIPTION

America's Central Port (ACP) is a 1,200-acre multi-modal business and industrial campus located in the municipalities of Madison, Venice, and Granite City, Illinois. Created in 1959, the Port provides access to three major freight transportation modes, including river, rail, and roadway. It is home to numerous manufacturers, suppliers, and other industrial and transportation-related businesses. It features the third largest inland port in the country, and access to four interstates and six Class 1 railroads.

In 2021, ACP received grant funding from the Illinois Department of Transportation (IDOT) to conduct an infrastructure assessment of its rail, road, and sewer/stormwater infrastructure to enable the Port to better manage these assets and make strategic capital investments. Juneau Associates, Inc., P.C. (JAIPC) subsequently contracted with ACP to conduct this assessment, with the assistance of two subcontractor team members - Visu-Sewer, Inc. and Design Nine, Inc. – who were responsible for completing evaluations of the sewer and rail infrastructure respectively.

This report presents the results of that assessment.

2.0 EXISTING FACILTIES

With the exception of buildings and freight loading facilities, ACP-owned infrastructure at the subject location consists of three major components: pipe sewers (including pump stations), roadways, and railways. Each of these components requires specialized inspection and evaluation.

2.1 Pipe Sewers

JAIPC's subcontractor, Visu-Sewer, Inc., was tasked with performing a field conditions assessment of the sanitary, storm, and combined sewer system serving the ACP facility. Internal inspections were conducted in sewer pipes and structures utilizing video cameras to identify and document defects and failures along the individual pipe runs. While not every linear foot of sewer was inspected, a sufficient portion of the system was evaluated to determine the sewer line conditions. Visu-Sewer and JAIPC worked directly with ACP

staff to select representative pipe runs, concentrating on areas of past sewer failures, capacity limitations, and locations where future development is expected.

As part of the inspection process, Visu-Sewer was responsible for cleaning the existing sewer systems and removing excess rock and debris where encountered to allow for improved flow conditions and to permit detailed inspection of the pipes and connections. While the project scope did not include removal of all debris and cleaning of every sewer line, ACP should note a substantial improvement in flow capacity and a reduction in flooding occurrence during heavier storm events.

Visu-Sewer cleaned and inspected more than 5.8 miles of sewer as part of this project and provided photographic and video records of their assessments to JAIPC for delivery to ACP. Pipes encountered ranged in size from 8-inches to 42-inches in diameter, and included reinforced concrete (RCP), vitrified clay (VCP), and polyvinyl chloride (PVC) pipes of varying ages and conditions.

2.1.1 Pump Station

Although not part of the infrastructure assessment project, the pump station located in the southeast quadrant of the intersection of 4th and D Streets is a critical part of the Port's sewer system and should be included in future maintenance and rehabilitation programs. This station was upgraded in 2009, including new pumps, accessories, and some structural elements as well. The plans for these upgrades are included with this report as Exhibit E.

2.2 Roadways

JAIPC conducted a road surface condition survey of the America's Central Port's 21 miles of roadway during three separate site visits. The survey was conducted by driving each roadway and taking photos of areas of distress that were representative of the general condition of the road. These photos and notes were then logged into a GIS map for the Port's records.

Included in the report are roadway condition ratings, notes on the deficiencies of each roadway, recommended repair or maintenance work, and estimated unit costs associated with completing the work. (Reference Exhibit F.)

2.3 Railways

The scope of work assigned to Design Nine, Inc. included a conditions assessment of

approximately 14.2 miles of rail track separated into two regions with a dividing line along Niedringhaus Avenue that runs in the West and East direction. The Madison Harbor is located South of Niedringhaus Avenue and Granite City Harbor located North of Niedringhaus Avenue. The assessment includes ratings, photographs, finding notes, recommended treatment, and recommended treatment schedule. The recommended treatments and improvements will aid the Port in the scheduling of future repairs and maintenance. (Reference Exhibit G.)

3.0 PIPE SEWER INVENTORY AND ASSESSMENT

As previously noted, Visu-Sewer, Inc. cleaned and inspected almost 31,000 linear feet of sanitary, storm, and combined sewer lines as part of this project. The data was entered into their Pipeline Assessment Certification Program (PACP) software, a software certification, inspection protocol, and coding protocol for pipe defects. Data is provided on all defects and observations, and each pipe is graded for structural, operational, and maintenance integrity and condition.

A summary of the results of the pipe inspections and printouts of data from the final PACP report is included with report as Exhibit A.

4.0 FIELD SURVEY

JAIPC survey personnel located each sewer manhole identified as part of the ACP system, basing their search on the existing available record data. The survey was conducted based on ACP's internal coordinate system using their network of ground control point. The survey data was then converted to Illinois West - State Plane Coordinate system and the NAD83 vertical datum for transfer into the ArcGIS mapping developed as part of this project.

Design Nine, Inc., completed most of their inventory and assessment work using the existing data they developed during the design of the expanded rail system over the past 10 years, supplementing, and expanding this information with new field survey when necessary to update the existing mapping to reflect current conditions.

5.0 ROADWAY INFRASTRUCTURE INVENTORY AND ASSESSMENT

Included in the report are roadway condition ratings, notes on the deficiencies of each roadway, recommended repair or maintenance work, and estimated unit costs associated with completing the work.

The purpose of this report is to provide the Port with the following:

- A detailed inventory of the Port road system.
- Documented conditions of each road on a GIS mapping system.
- Maintenance or repair method recommendations appropriate to each road.
- Estimated costs of each maintenance and repair method.

Exhibit F includes a full copy of JAIPC's final report with all relevant exhibits and estimates of cost.

6.0 RAILROAD INFRASTRUCTURE INVENTORY AND ASSESSMENT

Design Nine, Inc. was hired as a subconsultant to JAIPC, and was tasked with developing a report that strictly addresses the assessment of the rail infrastructure. The final deliverables of the assessment include a written report of findings and the JAIPC-provided GIS data for each infrastructure system in shapefile format.

Exhibit G includes a full copy of Design Nine's final report with all relevant exhibits and estimates of cost.

7.0 COST ESTIMATES

Each sub-section of the report includes estimates of costs for recommended repair and replacement work identified as part of this assessment. As these estimates are highly specific to each type of infrastructure and depend greatly upon decisions made by ACP administrators, this report does not include a summary of all the cost estimates, and instead leaves them in their original format in the individual reports included in the various exhibits.

8.0 INVENTORY MANAGEMENT TOOLS

JAIPC and their subcontractors have endeavored to make the data and assessments collected as part of this project as accessible to ACP personnel as possible. The infrastructure observations, recommendations, and cost estimates have been assembled in ArcGIS format for easy viewing and querying of data. This material will allow ACP administrators to select projects and seek funding for necessary repairs and improvements and allow them to focus available resources in the most critical areas and maximize the cost-efficiency of their project.

As noted elsewhere in this report, Visu-Sewer has provided ACP with their inspection database in an interactive spreadsheet. The spreadsheet can be searched by choosing a selection or selections of variables, and generate cost estimates of possible repair and/or replacement scenarios based on the variables selected.

9.0 CONCLUSIONS

The findings of this assessment indicate that a number of major and minor rehabilitation and reconstruction projects will be necessary over the coming years. Some improvements are more critical in nature and should be addressed as soon as possible to maintain the Port's operating capacity and minimize disruptions to shipping and transportation activities. This report provides the basic methodology for prioritizing these improvements, budget line estimates for maximizing the cost-effectiveness of proposed projects, and a framework for tracking and updating records to ensure Port personnel can keep this critical facility operating well into the 21st Century.

2. REMOVE AND REPLACE EXISTING VALVES, PIPES, AND CONTROLS IN VALVE VAULT, AND FURNISH AND INSTALL VALVES AND PIPES AS SPECIFIED AND SHOWN.
3. POTABLE GASOLINE POWERED VENTILLATION EQUIPMENT IS AVAILABLE AND USED BY THE TRI-CITY REGIONAL PORT DISTRICT, THE OWNER AND THE OPERATOR OF THE LIFT STATION.
4. PUMP MOTOR CABLE SHALL BE WITHOUT SPLICES SUITABLE FOR SUBMERSIBLE PUMP APPLICATION. ELECTRIC CABLE SHALL TERMINATE AT THE PUMP WITH A WATER TIGHT CABLE ENTRY WATER SEAL, AND INSIDE THE CONTROL PANEL AT T HE MOTOR STARTER TERMINAL BLOCK. EACH PUMP CABLE SHALL ENTER THE MOTOR CONTROL PANEL THROUGH A SEPARATE 2" CONDUIT. THE PUMP ELECTRIC CABLE SHALL BE REMOVED WITH THE SUBMERSIBLE PUMP WITH THE CABLE DISCONNECT MADE AT THE MOTOR STARTER TERMINAL STRIP.
5. 4" VENT PIPE AND PUMP GUIDE POSTS SHALL BE GALVANIZED STEEL.
6. ALL EXPOSED CONCRETE EDGES SHALL HAVE A 3/4" CHAMFER.

ELECTRICAL NOTES:

1. CONNECT GROUND BUS INSIDE THE PANEL WITH 2/0 BARE COPPER. CADWELD CONNECTED TO A 3/4"-10' COPPER CLAD GROUND ROD BURIED 2' BELOW GRADE.
2. ELECTRICAL SERVICE TO LIFT STATION CONTROL PANEL FROM POWER POLE SHALL BE RUN UNDERGROUND.
3. CONTRACTOR SHALL PROVIDE 1" CONDUIT FOR TELEPHONE CABLE.
4. ALL ENCLOSURES AND POWER SUPPLIES REQUIRING GROUNDING INSIDE THE PANEL ARE TO BE CONNECTED TO THE GROUND BUS BY GREEN INSULATED CABLE (MIN. #12 AWG).
5. SIZE STARTERS, BREAKERS, WIRES, AND CONDUITS BASED UPON ACTUAL MOTOR NAMEPLATE AMPS IN ACCORDANCE WITH THE LATEST NATIONAL ELECTRIC CODE.
6. STATOR TEMPERATURE SWITCHES ARE TO BE WIRED WHEN SUPPLIED WITH PUMP MOTOR.
7. TAPE AND TIE BACK UNUSED CONDUCTORS.
8. ESTIMATED MOTOR HP. GET ACTUAL HP FROM PUMP MANUFACTURER.

INVENTORY AND CONDITION ASSESSMENT OF ROAD SURFACES

America's Central Port

October 2021

Table of Contents

Appendices

1. Introduction

Juneau Associates, Inc., P.C. has conducted road surface condition survey of the America's Central Port's 21 miles of roadway during three separate site visits. The survey was conducted by driving each roadway and taking photos of areas of distress that were representative of the general condition of the road. These photos and notes were then logged into a GIS map for the Port's records.

Included in the report are roadway condition ratings, notes on the deficiencies of each roadway, recommended repair or maintenance work, and estimated unit costs associated with completing the work.

The purpose of this report is to provide the Port with the following:

- A detailed inventory of the Port road system.
- Documented conditions of the each road on a GIS mapping system.
- Maintenance or repair method recommendations appropriate to each road.
- Estimated costs of each maintenance and repair method.

2. General Roadway Information

Roadways can last up to 30 years, however, the lifespan is directly related to its construction, foundation, climate, drainage, and traffic. Depending on these factors a roadway may only last a few years.

Roadways consist of various elements including the surface type, subbase materials, cross slope, crown, width, shoulders, curbs, and drainage. Surface types are either rigid or flexible. Concrete roads are considered rigid, asphalt roads or concrete roads with an asphalt overlay are considered flexible. Road surface material is typically selected based on traffic volume, soil characteristics, weather, initial cost, overall annual maintenance and service-life cost. All of the Port roads are asphalt, Oil & Chip, or concrete. In some cases, unsuitable material below the roadway causes failure of the roadway.

The condition of a street is affected by a number of factors, including:

- Surface condition (roughness, cracking)
- Drainage (street profile, cross section, storm sewer)
- Street section (Pavement and base course thickness)
- Subgrade soil (sand, clay, silt)
- Traffic characteristics and loading
- Age
- Maintenance Program (Crack/Joint seal, microsurfacing, etc.)

3. Road Condition Survey

3.1 Inventory of Port Roads

The purpose of the inventory was to assess all the roads in the Port and identify various deficiencies with the roadway surface. Each road was then graded using the Pavement Surface Evaluation and Rating (PASER) system based on the severity of the deficiencies observed. The PASER ratings were then used to recommend various maintenance or improvement options. These recommendations are meant to be a guide for the Port, and used in conjunction with the Port's priorities and budget to determine the best course of action to extend the life of the road surface. Only Port maintained roads were included. Private roads were not inventoried.

3.2 Evaluating Roads

The roads were evaluated and graded using the PASER system for asphalt and concrete surfaces. PASER uses visual inspection to identify different types of pavement distress. There are four major categories of common concrete and asphalt distresses as shown below.

A. Concrete Surface Distress

1.) Surface Defects: Wearing and Polishing, Map Cracking, Pop-outs, Scaling, Shallow Reinforcing, and Spalling.
2.) Joint Failure: Transverse and Longitudinal
3.) Pavement Cracks: Transverse Slab Crack, D-Cracking, Corner Cracking and Meander Cracking
4.) Pavement Deformation: Blow Ups, Faulting, Pavement Settlement or Heave, Utility Repairs, Patches and Potholes, Manhole and Inlet Cracking, and Curb or Shoulder Deformation

B. Asphalt Surface Distress

1.) Surface Defects: Raveling, Flushing, and Polishing
2.) Surface Deformation: Rutting, Rippling, Shoving, Settling, and Frost Heave
3.) Cracks: Transverse, Reflection, Slippage, Longitudinal, Block, and Alligator cracks
4.) Patches and Potholes

Examples of the various distresses are provided in Appendix A

The PASER system rates roads on a scale of 1-10. We used a simplified version of this by grading each road as Poor (1-3), Fair (4-7), or Good (8-10).

4. Maintenance and Repair Alternatives

There are three categories of maintenance/repairs available for maintaining roadway infrastructure: Preventative Maintenance, Road Rehabilitation, and Road Reconstruction. A brief overview of each category is followed by a more detailed description of the individual alternatives and their estimated costs.

1. Preventive Maintenance: Preventative maintenance is appropriate for roads in good condition. Preventative maintenance includes microsurfacing, patching, and crack/joint sealing, of roads that are in good condition to prevent or slow further deterioration. This is a relatively inexpensive repair that will extend the life of the road surface 2-7 years.

2. Rehabilitation: Rehabilitation is appropriate for roads in fair condition, or roads in poor condition that don't appear to have extensive base failure. Rehabilitation are major repairs of the road surface without changing the subgrade. This includes the removal of the existing road surface and overlaying with a Hot-Mix asphalt surface course. For cost estimating purposes a 2 inch milling and overlay were assumed. Rehabilitation can extend the life of the existing roadway 10-15 years.

3. Reconstruction: Reconstruction is appropriate for roads in Poor condition with extensive base failure. Reconstruction consists of complete replacement of the road subbase and surface. Reconstruction can also include lane widening, alignment or profile adjustments, and changes to address surface drainage issues. Reconstruction is the most expensive repair alternative, and the service life of a new pavement structure is 30 years.

4.1 Alternatives

Crack/Joint Sealing – Concrete (Preventative Maintenance)

Description: This process involves cleaning and routing cracks and/or joints and then filling them with hot rubber sealing compound. Sealing the cracks and/or joints inhibits water from penetrating the cracks, freezing and expanding and causing the pavement to fail.

Cost: An estimate of cost for this alternative is $1.00 per square yard of roadway to be maintained, but will vary with the severity of cracking and joint spacing.

Figure 1 - Joint Sealing Concrete

Crack Sealing – Asphalt (Preventative Maintenance)

Description: This process involves using a mechanical device to rout each crack in order to widen, cut, and clean the cracks prior to filling with bituminous materials. The bituminous materials fill the entire volume of the crack providing structural integrity to the pavement while also preventing moisture from entering the pavement structure.

Cost: An estimate of cost for this alternative is $1.00 per square yard of roadway to be maintained, but will vary with the severity of cracking.

Figure 2- Crack Routing & Sealing

Microsurfacing – Asphalt (Preventative Maintenance)

Description: This process uses a mixture of polymer modified emulsified asphalt, aggregate, mineral filler, water, and other additives. A specialized machine mixes and evenly spreads a thin layer of the composite material over the existing road surface. This preventative maintenance treatment fills in small cracks and helps preserve surfaces suffering from oxidation, loss of skid resistance, and raveling.

Cost: An estimate of cost for a one pass Microsurfacing treatment is $4.25 per square yard.

Figure 3 - Microsurfacing

Mill and Overlay, 2” – Asphalt (Rehabilitation)

Description: Milling is a process by which the top section of pavement is milled off and discarded. This results in a rough surface to which and additional layer of pavement can be applied. This treatment can be used to remedy substantial surface defects as long as extensive base failure is not present.

Cost: An estimate of cost for milling and placing 2” of Hot Mix Asphalt is approximately $20 per square yard.

Figure 4 - Mill and Overlay

Pavement Patching

Description: Pavement patching can be used to fix failed areas of concrete or asphalt pavement when a complete reconstruction is not necessary. When patching concrete pavement the full slab depth of the failed area is removed and replaced and the surrounding joints are resealed. When patching asphalt the pavement structure (pavement surface and base) is removed and replaced with a full depth asphalt patch. Asphalt patching is usually used in conjunction with a mill and overlay or other rehabilitation/preservation treatment to spot fix failed areas that can not be addressed by the main treatment.

Cost: An estimate of cost for concrete pavement patching is $125.00 per square yard, and 6” asphalt patches are $65.00 per square yard.

Figure 5 - Concrete and Asphalt Patches

Full Re-Construction

Description: Re-Construction consists of the removal of the entire pavement structure (pavement surface and subbase) and installation of new aggregate subbase and pavement. The new pavement surface could be asphalt or concrete depending on the amount of traffic and the kind of loads the pavement will see. This option is the most expensive and will only be necessary when subbase failure is too extensive to make rehabilitation feasible.

Cost: An estimate of cost for this alternative is $ 175.00 per square yard for 10” PCC Pavement. This cost includes the removal and replacement of the existing subbase and pavement surface as well as all ancillary work typical with a full reconstruction.

APPENDIX A

SURFACE DEFECTS

Raveling

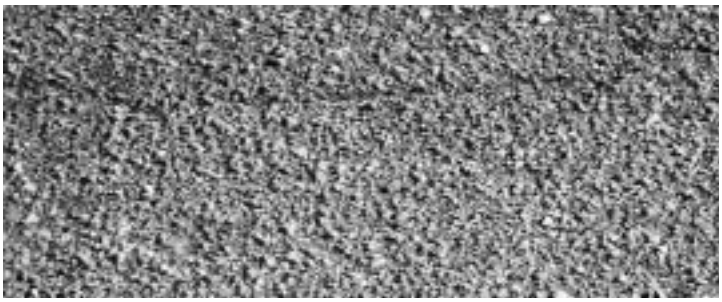
Raveling is progressive loss of pavement material from the surface downward, caused by: stripping of the bituminous film from the aggregate, asphalt hardening due to aging, poor compaction especially in cold weather construction, or insufficient asphalt content. Slight to moderate raveling has loss of fines. Severe raveling has loss of coarse aggregate. Raveling in the wheelpaths can be accelerated by traffic. Protect pavement surfaces from the environment with a sealcoat or a thin overlay if additional strength is required.

Flushing

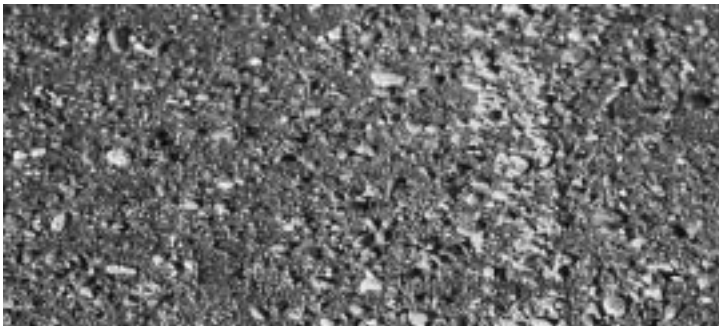
Flushing is excess asphalt on the surface caused by a poor initial asphalt mix design or by paving or sealcoating over a flushed surface. Repair by blotting with sand or by overlaying with properly designed asphalt mix.

Polishing

Polishing is a smooth slippery surface caused by traffic wearing off sharp edges of aggregates. Repair with sealcoat or thin bituminous overlay using skid-resistant aggregate.



◄ **Slight raveling. Small aggregate particles have worn away exposing tops of large aggregate.**

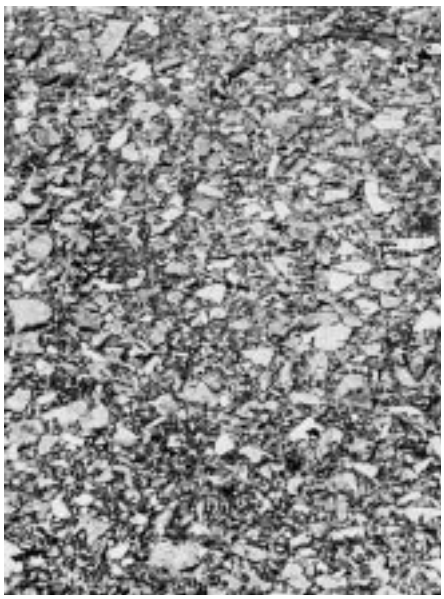


◄ **Moderate to severe raveling. Erosion further exposes large aggregate.**

◄ **Severe raveling and loss of surface material.**

Polished, worn aggregate needs repair. ▼

► **Flushing. Dark patches show where asphalt has worked to surface.**



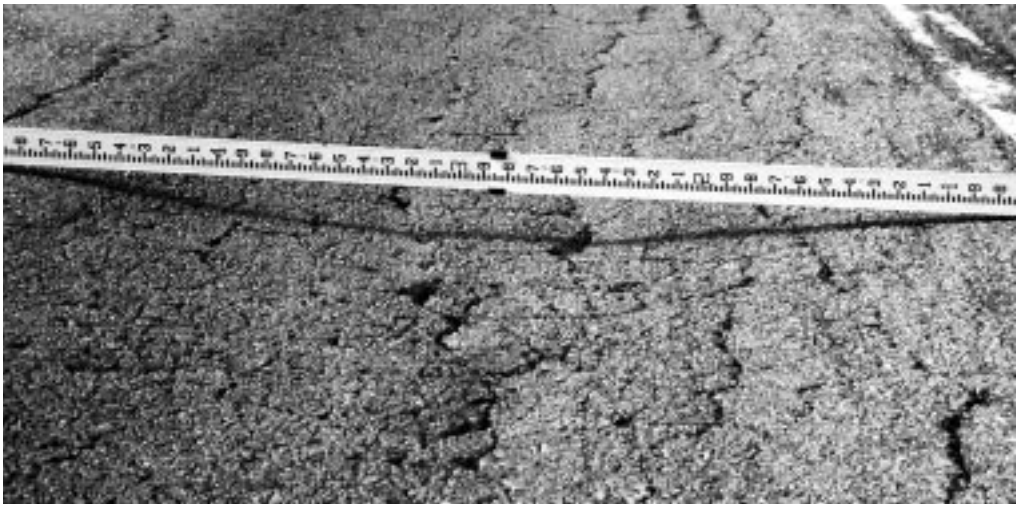
SURFACE DEFORMATION

Rutting

Rutting is displacement of material, creating channels in wheelpaths. It is caused by traffic compaction or displacement of unstable material. Severe rutting (over 2") may be caused by base or subgrade consolidation. Repair minor rutting with overlays. Severe rutting requires milling the old surface or reconstructing the roadbed before resurfacing.

◄ **Even slight rutting is evident after a rain.**

◄ **Severe rutting over 2" caused by poor mix design.**



◄ **Severe rutting caused by poor base or subgrade.**

Distortion

Shoving or rippling is surfacing material displaced crossways to the direction of traffic. It can develop into washboarding when the asphalt mixture is unstable because of poor quality aggregate or improper mix design. Repair by milling smooth and overlaying with stable asphalt mix.

Other pavement distortions may be caused by settling, frost heave, etc. Patching may provide temporary repair. Permanent correction usually involves removal of unsuitable subgrade material and reconstruction.

▼ **Heavy traffic has shoved pavement into washboard ripples and bumps.**

► **Severe settling from utility trench.**

► **Frost heave damage from spring break-up.**

▼ **Widely spaced, well-sealed cracks.**

CRACKS

Transverse cracks

A crack at approximately right angles to the center line is a transverse crack. They are often regularly spaced. The cause is movement due to temperature changes and hardening of the asphalt with aging.

Transverse cracks will initially be widely spaced (over 50'). Additional cracking will occur with aging until they are closely spaced (within several feet). These usually begin as hairline or very narrow cracks; with aging they widen. If not properly sealed and maintained, secondary or multiple cracks develop parallel to the initial crack. The crack edges can further deteriorate by raveling and eroding the adjacent pavement.

Prevent water intrusion and damage by sealing cracks which are more than ¼" wide.

◄ **Sealed cracks, a few feet apart.**

▲ **Tight cracks less than ¼" in width.**

▲ **Open crack – ½" or more in width.**

▲ **Water enters unsealed cracks softening pavement and causing secondary cracks.**

▲ **Pavement ravels and erodes along open cracks causing deterioration.**

Reflection cracks

Cracks in overlays reflect the crack pattern in the pavement underneath. They are difficult to prevent and correct. Thick overlays or reconstruction is usually required.

► **Concrete joints reflected through bituminous overlay.**

Slippage cracks

Crescent or rounded cracks in the direction of traffic, caused by slippage between an overlay and an underlying pavement. Slippage is most likely to occur at intersections where traffic is stopping and starting. Repair by removing the top surface and resurfacing using a tack coat.

► **Crescent-shaped cracks characteristic of slippage.**

► **Loss of bond between pavement layers allows traffic to break loose pieces of surface.**

Centerline crack (still tight). ►

Edge cracking from weakened subbase and traffic loads. ▼

Longitudinal cracks

Cracks running in the direction of traffic are longitudinal cracks. Center line or lane cracks are caused by inadequate bonding during construction or reflect cracks in underlying pavement. Longitudinal cracks in the wheel path indicate fatigue failure from heavy vehicle loads. Cracks within one foot of the edge are caused by insufficient shoulder support, poor drainage, or frost action. Cracks usually start as hairline or vary narrow and widen and erode with age. Without crack filling, they can ravel, develop multiple cracks, and become wide enough to require patching.

Filling and sealing cracks will reduce moisture penetration and prevent further subgrade weakening. Multiple longitudinal cracks in the wheel path or pavement edge indicate a need for strengthening with an overlay or reconstruction.

► First stage of wheelpath cracking caused by heavy traffic loads.

Load-related cracks in wheel path plus centerline cracking. ▼

Multiple open cracks at center line, wheelpaths and lane center. ▼

Block cracks

Block cracking is interconnected cracks forming large blocks. Cracks usually intersect at nearly right angles. Blocks may range from one foot to approximately 10′ or more across. The closer spacing indicates more advanced aging caused by shrinking and hardening of the asphalt over time. Repair with sealcoating during early stages to reduce weathering of the asphalt. Overlay or reconstruction required in the advanced stages.

► **Large blocks, approximately 10′ across.**

► **Intermediate-size block cracking, 1′-5′ across with open cracks.**

▲ **Extensive block cracking in an irregular pattern.**

► **Severe block cracking – 1′ or smaller blocks. Tight cracks with no raveling.**

Alligator cracks

Interconnected cracks forming small pieces ranging in size from about 1" to 6". This is caused by failure of the surfacing due to traffic loading (fatigue) and very often also due to inadequate base or subgrade support. Repair by excavating localized areas and replacing base and surface. Large areas require reconstruction. Improvements in drainage may often be required.

◄
Alligator crack pattern. Tight cracks and one patch.

◄
Characteristic "chicken wire" crack pattern shows smaller pavement pieces and patching.

◄
Open raveled alligator cracking with settlement along lane edge most likely due to very soft subgrade.

PATCHES AND POTHOLES

Patches

Original surface repaired with new asphalt patch material. This indicates a pavement defect or utility excavation which has been repaired. Patches with cracking, settlement or distortions indicate underlying causes still remain. Recycling or reconstruction are required when extensive patching shows distress.

► **Typical repair of utility excavation. Patch in fair to good condition.**

► **Edge wedging. Pavement edges strengthened with wedges of asphalt. Patch is in very good condition.**

► **Extensive patching in very poor condition.**

Potholes

Holes and loss of pavement material caused by traffic loading, fatigue and inadequate strength. Often combined with poor drainage. Repair by excavating or rebuilding localized potholes. Reconstruction required for extensive defects.

◄
Small pothole where top course has broken away.

◄
Multiple potholes show pavement failure, probably due to poor subgrade soils, frost heave, and bad drainage.

◄
Large, isolated pothole, extends through base. Note adjacent alligator cracks which commonly deteriorate into potholes.

SURFACE DEFECTS

Wear and polishing

A worn or polished surface may appear from traffic wearing off the surface mortar and skid resistant texture. Extensive wear may cause slight ruts where water can collect and cause hydroplaning. Sometimes traffic may polish aggregates smooth, causing the surface to be slippery. An asphalt overlay or grinding of the concrete surface can restore skid resistance and remove ruts.

► **Surface mortar worn away exposing larger aggregate. Accidents or friction testing may indicate a slippery surface in need of improved texture.**

▲ **Close-up of a polished pavement surface.**

Map cracking

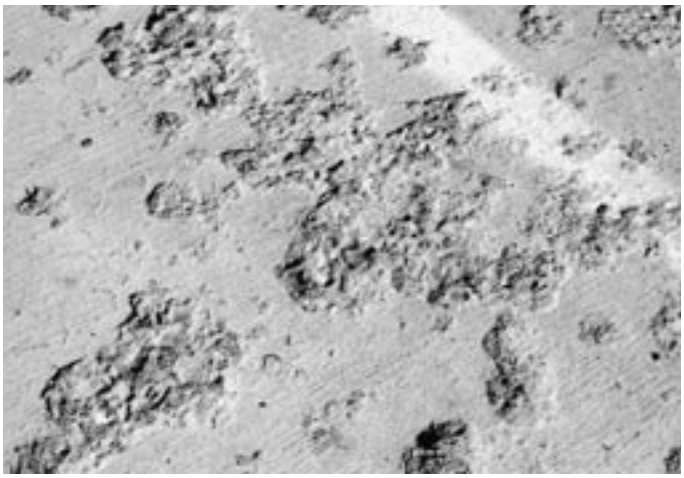
A pattern of fine cracks usually spaced within several inches is called map cracking. It usually develops into square or other geometrical patterns. Can be caused by improper cure or overworking the surface during finishing. If severe, cracks may spall or surface may scale. Repair is usually limited to very severe conditions. An asphalt overlay or partial depth patching may then be necessary.

◄ **Hairline surface cracks, probably shallow in depth. May not cause any long term performance problems.**

Pop-outs

Individual pieces of large aggregate may pop out of the surface. This is often caused by chert or other absorbent aggregates that deteriorate under freeze-thaw conditions. Surface patching can be done temporarily with asphalt. For severe areas, a more permanent partial depth concrete patch may be necessary.

◄ **Extensive pop-outs of large aggregate from surface. Pop-outs alone have not affected pavement serviceability.**



► **Moderate surface scaling. Loss of mortar and fines from the surface beginning to expose larger aggregate.**

► **Severe scaling. Some larger aggregate is loose.**

Reinforcing bar exposed. Shallow concrete cover caused large spall to develop around it. ▼

Scaling

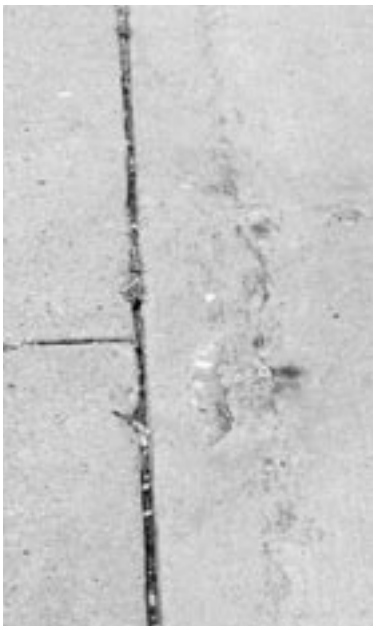
Scaling is surface deterioration that causes loss of fine aggregate and mortar. More extensive scaling can result in loss of large aggregate. Often caused by using concrete which has not been air-entrained, the surface becomes susceptible to freeze-thaw damage. Scaling is also aggravated by the use of deicing chemicals.

Scaling can occur as a general condition over a large area or be isolated to locations where poor quality concrete or improper finishing techniques caused loss of air entrainment. In severe cases, deterioration can extend deep into the concrete. Traffic action may accelerate scaling in the wheel paths.

Grinding may remove poor quality surface concrete. Asphalt overlays or a bonded concrete resurfacing can prolong the life of the pavement. Partial depth patching of isolated areas may also be used.

Shallow reinforcing

If the steel reinforcing bar or mesh is placed too close to the concrete surface it will lead to concrete spalling. Corrosion of the steel creates forces that break and dislodge the concrete. Often you can see rust stains in the surface cracks before spalling occurs. Can be temporarily patched with asphalt. Permanent repairs are difficult and usually involve replacing the steel and making a partial depth or full depth concrete repair.



◄ **Wire reinforcing mesh placed close to surface. Corrosion of the reinforcing steel causes the surface mortar to spall. Very difficult to patch and repair.**

◄ **Surface stain parallel to joint. Indicates reinforcing steel too close to surface.**

Spalling

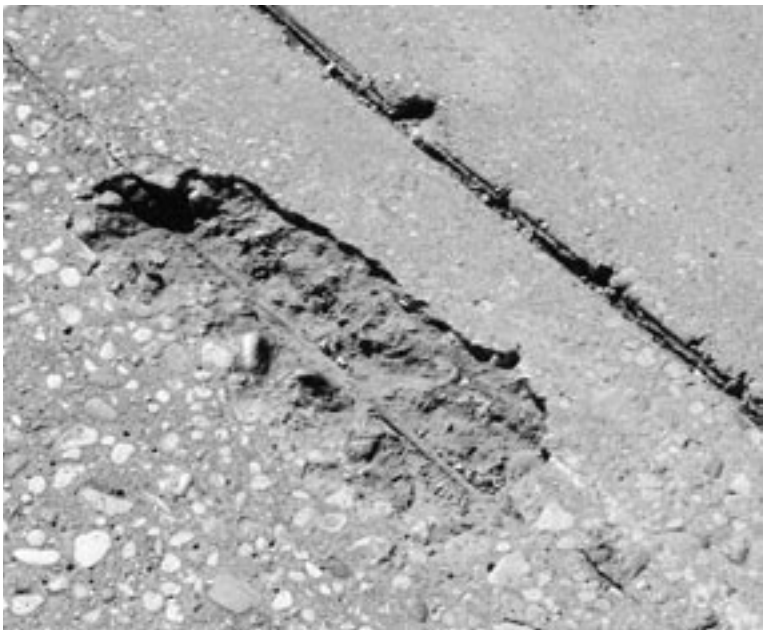
Spalling is the loss of a piece of the concrete pavement from the surface or along the edges of cracks and joints. Cracking or freeze-thaw action may break the concrete loose, or spalling may be caused by poor quality materials. Spalling may be limited to small pieces in isolated areas or be quite deep and extensive.

Repair will depend on the cause. Small spalled areas are often patched. Spalling at joints may require full depth joint repair.

► **Small surface spalls that have been patched.**

► **Spalling along longitudinal joints.**

▼ **A severely spalled crack.**



Spalling over ► shallow reinforcing.

▲ **Joint open about ½".**

◄ **New, well-sealed longitudinal joint.**

JOINTS

Longitudinal joints

Longitudinal paving joints are constructed to be narrow in width and usually well sealed. As pavements age and materials deteriorate, joints may open and further deteriorate. Cracks parallel to the initial joint may develop and accelerate into spalling or raveling of the longitudinal joint. Settlement, instability, or pumping of the subgrade soil can cause longitudinal joints to fault. One common cause of cracks parallel to the longitudinal joints is waiting too long after the pour to saw the joint. Then, during initial cure the slab will crack roughly parallel (but not exactly) to the sawn joint.

Maintaining a tight joint seal can prevent intrusion of water and reduce freeze-thaw damage and pumping. Severe joint deterioration may require full depth patching and replacement of the joint.

▲ **Additional joint cracking, spalling, and broken pavement. Full depth repair is needed.**

▲ **Faulted longitudinal joint (over ½") with slight edge spalling.**

Transverse joints

Transverse joints are constructed in concrete pavements to permit movement of the concrete slabs. Some joints are constructed with load transfer dowels. If the pavement has poor subsurface drainage, traffic may eventually create voids under the joints due to pumping and cause the slabs to settle or fault. Freeze-thaw deterioration at the joint can cause spalling and create additional cracks parallel to the joint. Load transfer bars may corrode, creating expansive forces that further deteriorate the concrete at the joint.

Occasionally, severe joint deterioration may develop from poor quality aggregate and so-called D-cracking. Joint sealing will help, but complete replacement is usually necessary.

Overall, lack of joint maintenance and rehabilitation is a common problem. Maintaining a tight, well sealed joint can reduce water intrusion and thereby reduce freeze-thaw damage, pumping, blow-ups, D-cracking, and spalling. Early repair of minor defects can often reduce the need for complete joint repair or replacement.

▼ **New, well-sealed transverse joint.**

▼ **Transverse joint has slight faulting and spalling.**

► **Severe spalling of a transverse joint.**

►► **Cracks parallel to joint. Dark color next to transverse joint likely indicates D-cracking and additional deterioration. Full depth repair required.**

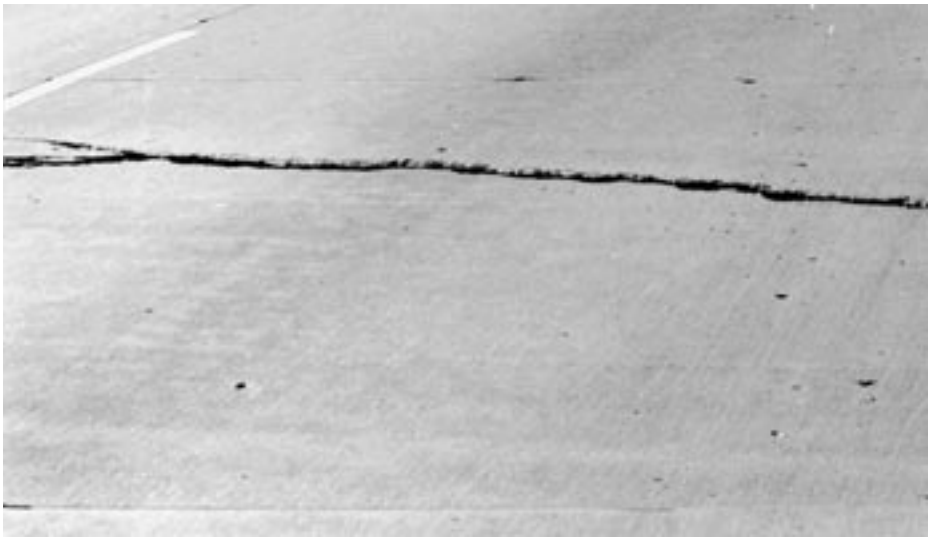
► **Severe spalling has required temporary patching. Complete joint replacement is necessary.**

PAVEMENT CRACKS

Transverse slab cracks

Transverse cracks may appear parallel to joints and can be caused by thermal stresses, poor subgrade support, or heavy loadings. They are sometimes related to slabs having joints spaced too widely. Joints spaced more than 15′ apart commonly develop mid-slab transverse cracks.

◄ **Transverse, open crack.**



◄ **Faulted transverse crack with slight edge spalling.**

As with joints, these cracks may deteriorate further if not sealed well. Slabs can fault at cracks which can spall and develop additional parallel cracking. Severe deterioration may require patching individual cracks. Multiple transverse cracks in individual slabs indicate further deterioration. Extensive transverse cracking indicates pavement failure and the need for complete replacement.

◄ **Closely spaced, hairline transverse cracks. Indicates slab is broken and in need of replacement.**

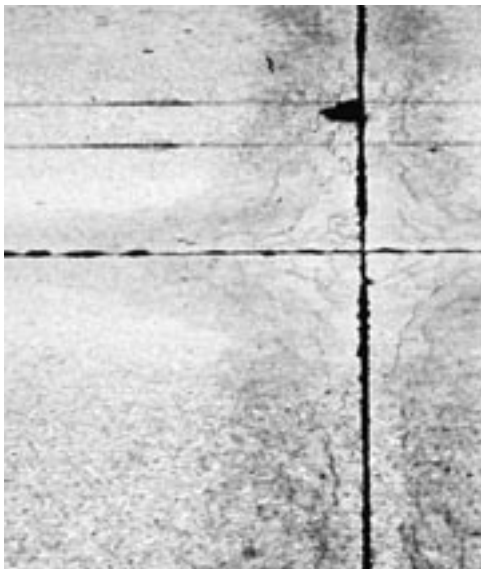
D-cracks

Occasionally, severe deterioration may develop from poor quality aggregate. So called D-cracking develops when the aggregate is able to absorb moisture. This causes the aggregate to break apart under freeze-thaw action which leads to deterioration. Usually, it starts at the bottom of the slab and moves upward.

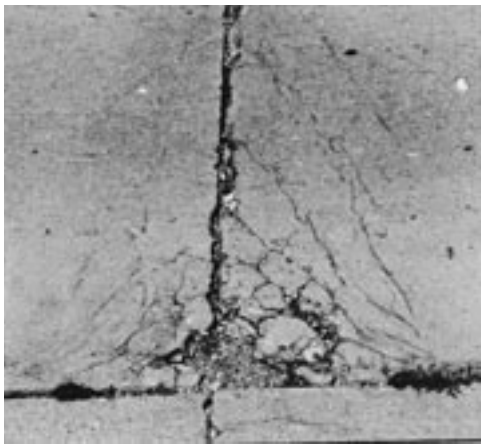
Fine cracking and a dark discoloration adjacent to the joint often indicate a D-cracking problem. Once this is visible on the surface the pavement material is usually severely deteriorated and complete replacement is required.

Joint or crack sealing helps slow D-cracking deterioration. This is a serious defect because it may indicate a material quality problem throughout the pavement.

Surface discoloration near joints and cracks indicates D-cracking and severe slab deterioration.
▼ ►



►
Multiple crack patterns adjacent to joints. Common D-cracking pattern.



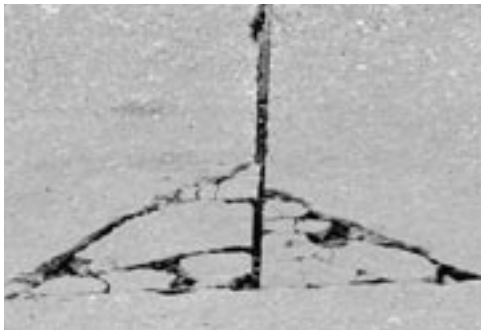
Corner cracks

Diagonal cracks near the corner of a concrete slab may develop, forming a triangle with a longitudinal and transverse joint. Usually these cracks are within one foot of the corner of the slab. They are caused by insufficient soil support or concentrated stress due to temperature related slab movement. The corner breaks under traffic loading. They may begin as hairline cracks.

Some corner cracks extend the full depth of the slab while others start at the surface and angle down toward the joint. With further deterioration, more cracking develops; eventually the entire broken area may come loose. This may be a localized failure or may point to widespread maintenance problems.

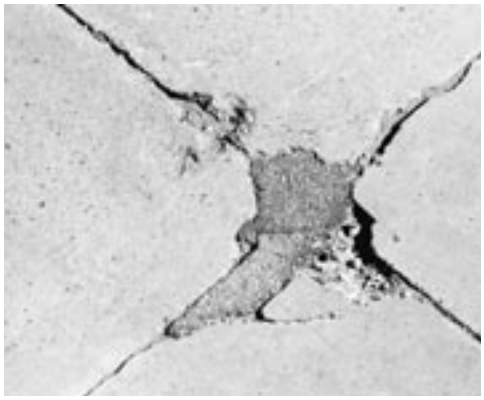
Partial or full depth concrete patching or full depth joint replacement may be necessary when corner cracking is extensive.

Corner cracking with ► broken concrete pieces.



▲ First signs of corner cracking.

►
Severely spalled corner crack with missing pieces and patching.



Meander cracks

Some pavement cracks appear to wander randomly. They may cross a slab diagonally or meander like a serpent. Meander cracks may be caused by settlement due to unstable subsoil or drainage problems, or by utility trench settlement. Frost heave and spring thaw can also cause them. They are often local in nature and may not indicate general pavement problems.

Minor cracks may benefit from sealing to minimize water intrusion. Extensive or severe meander cracking may require replacing the slab, stabilizing the subsurface, or improving drainage.

◄ **Meander crack roughly parallel to longitudinal joint.**

◄ **Meander crack caused by settlement. Lack of maintenance allows water to intrude and debris to collect in crack.**

◄ **Faulting and spalling of a meander crack.**

PAVEMENT DEFORMATION

Blowups

Concrete slabs may push up or be crushed at a transverse joint. This is caused by expansion of the concrete where incompressible materials (sand, etc.) have infiltrated into poorly sealed joints. As a result, there is no space to accommodate expansion. It is more common in older pavements with long joint spacing. Pressure relief joints can be installed and blowup areas must be patched or reconstructed.

Faulting

Joints and cracks may fault or develop a step between adjacent slabs. Faulting is caused by pumping of subgrade soils and creation of voids. Heavy truck or bus traffic can rapidly accelerate faulting. Longitudinal joints may fault due to settlement of an adjacent slab.

Faulting creates a poor ride and may cause slab deterioration. Minor faulting can be corrected by surface grinding. Voids can be subsealed, or slabs mud jacked back to level position. Severe cases may need joint replacement.

◄ **Internal pressure has partially raised slab at the joint. Complete replacement is required.**

A pavement blowup in progress. Concrete is crushed and slabs buckled. ▼

▲ **Faulted longitudinal joint.**

► **Severely faulted joint. Slab jacking is necessary.**

▲ **Minor faulting of transverse joints. Aggravated by heavy traffic. Surface grinding will improve ride.**

AMERICA'S CENTRAL PORT
GRANITE CITY & MADISON HARBOR
RAIL INFRASTRUCTURE
CONDITIONS ASSESSMENT REPORT
GRANITE CITY, MADISON COUNTY, ILLINOIS

I. Introduction

1. America's Central Port ("Port") has grown to be one of the largest freight hubs in the Midwest with two (2) multimodal harbors containing development ready sites and industrial real estate with rail access.

2. These multimodal harbors have seen substantial volume growth utilizing the rail infrastructure from both existing and new tenants who have developed rail-served facilities.

3. With increase in rail car volume the Port has implemented standards that meet or exceed FRA Class I railroad standards. The implementation of these standards is apparent throughout the Port as the original rail infrastructure is replaced and rehabilitated and the new rail infrastructure is placed in-service.

4. While performing this rail infrastructure assessment it is apparent that the current maintenance program is being successfully executed on a regularly scheduled basis with repairs being made on a time basis as required to properly maintain the infrastructure exceeding the Federal Railroad Administration Class 1 Track Safety Standards pursuant to 49 C.F. R. Part 213.

II. Background

1. The Port, more recently known as the Tri-City Regional Port District, is a municipal corporation of the State of Illinois created in 1959 to promote economic development and transportation in Southwestern Illinois. The Port manages a 1,200-acre industrial park in the cities of Granite City, Madison, and Venice, Illinois, approximately ten (10) minutes north of downtown St. Louis, Missouri. Originally the Port was a U.S. Army Depot and Melvin Price Support Center.

2. The Port has received grant funding from the Illinois Department of Transportation (IDOT) to conduct an infrastructure conditions assessment of its rail, roadway, and sewer/stormwater infrastructure to enable the Port to adequately manage the assets while making strategic capital investments.

3. Design Nine, Inc. is a subconsultant to Juneau Associates, Inc., P.C. (Juneau) and was assigned a Subcontract to develop a report addressing the rail infrastructure conditions assessment.

4. Assessment was performed by Michael P. Atzert and Eric M. Gerecke, Design Nine, Inc., between July and December 2021.

5. The scope of this report includes a conditions assessment of approximately 14.2 miles of track separated into two (2) regions with a dividing line along Niedringhaus Avenue that runs in the East and West direction. The Madison Harbor is located South of Niedringhaus Avenue and Granite City Harbor located North of Niedringhaus Avenue. The assessment report includes ratings of the existing conditions of the rail facilities, photographs, inspection notes, recommended treatment(s) along with a recommended treatment schedule. This condition assessment will aid the Port in the scheduling of repairs and continued maintenance of the facility.

6. Rail assets located on the property but presumed to be maintained by other parties have not been included in this report. The exact location of rail asset ownership and maintenance has not been defined by the Port. The limits of the rail assets evaluated for this report were defined in the Juneau supplied Exhibit A.1 and Exhibit A.2 “America’s Central Port Railroad Inventory Map, City of Granite City, Illinois” dated 05/14/2021 attached as an Appendix.

7. Railroad automatic grade crossing warning signals and their associated equipment was not assessed.

8. The final deliverables of the rail condition assessment include this written report of findings and the Juneau created GIS data for the rail infrastructure system in shapefile format.

9. A schematic is attached as an Appendix to this report that identifies the tracks, turnouts, at-grade crossings, rail crossings and areas where there is direct fixation of

track. The first sheet is of the Madison Harbor and the second sheet is of the Granite City Harbor.

10. Madison Harbor has four (4) entities that own their own track and turnouts. At this time the Terminal Railroad Association of St. Louis (TRRA) interchanges with the Port Harbor Railroad (PHRR, a Class III common carrier). The interchange tracks are officially identified as Tracks C-18 and C-19 within the A&K Railroad Materials facility. The PHRR provides full service switching for all rail-served tenants at this location via published tariffs. The track owned and maintained by the Port has the trackage rights leased to the PHRR to service the customers. Of the tenants receiving rail services, there are four (4) that own and maintain their track and turnouts:

    a. Green Plains (GP): There is a west and east lead track for PHRR to enter this facility. All trackage within the derails and the GP fence line is owned and maintained by GP. GP does have a track mobile to maneuver rail cars within their plant as required.

    b. Mattingly Lumber (ML): The trackage within the ML fence line is owned and maintained by ML. ML does not have their own power at this time and all rail cars are constructively placed by PHRR.

    c. Airgas (AG): The turnout and trackage into and within the AG facility is owned and maintained by AG. AG does not have their own power and all rail cars are constructively placed by PHRR.

    d. St. Louis Screw & Bolt (STLSB): The track immediately behind and adjacent to their warehouse, as well as the turnout to access the cross-over at E Street (Turnout SB-01) is owned and maintained by STLSB. STLSB does not have their own power and all rail cars are constructively placed by PHRR.

11. Granite City Harbor has several entities that own or are contracted to maintain certain tracks and turnouts. At the time of this report, the Norfolk Southern Corporation (NS) is the serving railroad at the Granite City Harbor and is responsible for constructively placing all rail cars for each terminal. Of all the terminals, only SCF, Plateplus and US Steel have their own motive power to maneuver rail cars through their terminal facility after constructive placement. Tenants with their own motive power do not provide any switching service to any other tenant.

    a. Plateplus has a small track mobile that moves rail cars along their side tracks at both of their facilities. This track mobile does not operate past the point of derail of either facility, one is located north, and one is located south of the A-Lead Track.

    b. APEX Oil has the NS place their rail cars directly at the loadout racks and remove them upon their being released.

    c. SCF operates three (3) facilities within the Granite City Harbor; 1) Red Dock, 2) White Dock and 3) southern half of Bulkhead Dock.

d. Red Dock has their rail cars constructively placed by the NS onto the facility tracks. There is a cable pully system that can cycle rail cars through the unloading pit. SCF has an engine available for supplemental power as maybe required.

e. The White Dock has their rail cars constructively placed by the NS onto several tracks adjacent to the facility. SCF has an engine available for power to maneuver the train set through the unloading pit as required.

f. SCF (via Midcoast) operates on the southern half of the Bulkhead Dock for steel and fertilizer commodities in general (capability for other commodities as market(s) dictate). The NS constructively places rail cars on tracks adjacent to the facility and SCF has an engine available for power to maneuver rail cars through the facility.

g. US Steel, when operating at the harbor, has a lease for the north half of the Bulkhead Dock. Their rail cars are constructively placed by the NS to the tracks adjacent to the facility where they have their own engine as power to maneuver rail cars through the facility.

III. Definition

1. **Appendix** – Supplementary materials providing additional information to the main body of the report.

2. **Attachment** – Supplementary items or documents that is appended to the main body of the report.

3. **Battered Rail End** – Surface deformation, flattening and widening of the head of the rail in the immediate vicinity of the end of the rail. Proper maintenance of rail joints includes track alignment, surface, cross slotting and track bolt tightening.

4. **Continuous welded rail (CWR)** – Rail sections that are welded end to end into rail strings that result in a rail without rail joints exceeding four hundred (400) feet; also referred to as welded rail or ribbon rail. Rail installed as CWR remains CWR, regardless of whether a joint or plug is installed into the rail at a later time.

5. **Crushed Head / Flattened Rail** – A length of rail, not at a joint, which has flattened out across the width of the rail head to a depth of three-eighths (3/8) inch or more below the rest of the rail and eight (8) inches or more in length. Crushed heads can be the result of wheel impacts due to geometry cross level anomalies or excess elevation in curves resulting in defect development on the low rail. Proper track surfacing, curve super-elevation and maintenance grinding of rail lessens this occurrence.

6. **Engine/Wheel Burn** – Overheating of the rail generated by slipping locomotive wheels producing friction combined with rapid cooling creates untempered martensite and thermal cracking. The pounding of wheels over time at the burned area results in

a horizontal separation of the burned metal from the parent metal and a noticeable flat spot will develop. Proper locomotive engineer training, proper traction levels on grades and the use of sanding when wheel slippage occurs are the most effective ways to reduce engine burns.

7. **Field Side** – The side of rail head away from wheel flange or outside the tread.

8. **Gauge Face Wear (Side Wear)** – The difference in the horizontal dimension between the new rail section and the worn rail section at a prescribed depth (5/8-inch) below the top of rail centerline point.

9. **Gauge Flow (Lip)** – Gauge flow is measured horizontally from the gauge side of the rail 5/8-inch below the current top of rail centerline point to the extreme point on the gauge side.

10. **Gauge Side** – The side of rail head adjacent to the wheel flange or to the inside of the track.

11. **Head Checking** – Head checks are shallow surface or hairline cracks that appear in the gauge corner of the rail head, at any angle with the length of the rail.

12. **L/V Ratio** – Quotient for measuring dynamic loading in the field or from theoretical analysis. The ratio can provide an indication of potential failures of a vehicle-track system. This vehicle-track interaction is the combined effect of the lateral dynamic loadings (L) and the vertical dynamic loadings (V) imposed by the vehicle on the track.

13. **Rail Head Width** – The horizontal distance from the gauge side to the field side of the rail head at a stated depth (5/8-inch) below the top of rail centerline point.

14. **Rail Lip** – A length of rail steel material that has undergone plastic deformation to form a folded layer overhanging at the lower edge of the rail head. This condition is typically found on the high side of curves.

15. **Rail Neutral Temperature** – The rail temperature at which there are no axial thermal forces in the rail section.

16. **Rail Wear** – A reduction of the rail head as a result of abrasive action between the steel wheel on the steel rail.

17. **Rolling Contact Fatigue (RCF)** – A form of rail fatigue damage originating primarily from cyclic loading in the wheel/rail interface zone.

18. **Shelling** – A rail head condition consisting of progressive subsurface horizontal separations that my crack out on the gauge side of the rail head. Shelling normally occurs on the upper gauge face of the rail head, and extend longitudinally.

19. **Spalling** – Cracking and chipping of the rail surface as a progression of head checking and flaking from rolling contact fatigue (RCF) creating high horizontal wheel-rail creeping forces, transverse friction forces and extreme wheel-rail contact stresses.

Selection and maintenance of correct rail super-elevations to match train speeds is most important. Proper friction control and lubrication practices can reduce the occurrence of spalling in curved track areas.

20. **Vertical Head Wear (Top Wear)** - The difference in the vertical dimension between the new rail section and the worn rail section at the top of rail centerline point.

IV. Condition Assessment Grading Scale

1. A condition assessment grading scale was created and applied to each turnout, at-grade crossing, rail crossing and section of track.

2. Assessment methodology comprised of walking each rail infrastructure element, recording and photographing visible observations of exposed elements not buried in debris or aggregate that would require extraordinary effort to uncover, and measuring key rail infrastructure elements manually with a tape measure, track gauge measuring device or GPS survey equipment.

3. Rail measurements and cross level were taken at locations between turnouts, at the points within the switching limits of turnouts, at points of curves, mid-points of curves, points of tangent and periodically along tangent track.

4. Life expectancy and failure rates of rail infrastructure elements from the subgrade to individual components are subject to many variables including the quality and frequency of maintenance, track alignment and grades, traffic density and volume, climate conditions, and materials.

5. The assessment used subjective inspection techniques and engineering judgement. This assessment/inspection does not guarantee that all defective, poor or failing conditions have been identified. Conditions that are hidden, inaccessible, covered, internal or not visibly seen with ordinary effort may have not been discovered or located.

6. All recommendations and condition grades (ratings) are the result of good faith subjective judgements and experience of the inspector(s) based on conditions present at the time of the assessment, utilizing industry standards and procedures and information that was made available to the inspector(s) prior to the submission of this report.

7. Conditions and standards can and do change, so frequent re-inspections and re-assessments is recommended.

8. The focus of this assessment was on the major elements of the rail infrastructure. It is recognized that OTM (other track material) such as spikes, rail anchors, rail joints and other items play a critical role in maintaining an operable railroad, this report does not address the standards currently being applied at this facility. Recommend that ACP follow the standards of the serving Railroad at each harbor and at a minimum meet

the recommendations of the American Railway Engineering and Maintenance-of-Way Association (AREMA). This report does address where the OTM is not performing as designed leading to negative impacts on associated components where a treatment is recommended.

9. The following table provides an outline of the condition grades developed by ASCE – American Society of Civil Engineers that has been adapted and modified for the assessment of the rail infrastructure.

I.D.	Grade	Description
A	Very Good	*Exceptional, Fit for Purpose/Future*: The infrastructure in the system or network is generally in excellent condition, typically new or recently rehabilitated, and meets the capacity needs for the future. A few elements show signs of general deterioration that require attention. Facilities meet modern standards for functionality and are resilient to withstand anticipated annual rail tonnage. **Treatment:** Only normal scheduled maintenance is required.
B	Good	*Good, Adequate for Now*: The infrastructure in the system or network is in good to excellent condition; some elements show signs of general deterioration that require attention. A few elements exhibit significant deficiencies. Safe and reliable, with minimal capacity issues and minimal risk. **Treatment:** Some minor repairs as required; function is okay.
C	Fair	*Mediocre, Requires Attention*: The infrastructure in the system or network is in fair to good condition; it shows general signs of deterioration and requires attention. Some elements exhibit significant deficiencies in conditions and functionality, with increasing vulnerability to risk. **Treatment:** More minor repairs required; mostly functional.
D	Poor	*Poor, At Risk*: The infrastructure is in poor to fair condition and mostly below standard, with many elements approaching the end of their service life. A large portion of the system exhibits significant deterioration. Condition and capacity are of serious concern with strong risk of failure. **Treatment:** Significant repairs required; system not fully functional for use; does not meet current standards.
E	Very Poor	*Failing/Critical, Unfit for Purpose*: The infrastructure in the system is in unacceptable condition with widespread advanced signs of deterioration. Many of the components of the system exhibit signs of imminent failure. **Treatment:** Major repair or replacement required to restore function; system unsafe. If repairs are not addressed, facilities to be taken out of service.

V. Assessment Criteria

1. The service life of rail infrastructure is influenced by a track maintenance program, speed and traction of power units, proper friction control, track geometry conditions and curvature, rail profile, rail weight and condition, size of tie plates, size and condition of cross ties, annual rail car tonnage (traffic density) and ballast type and condition. These all interact and factor into the development of defects, premature failure, reduced service life and need for increased frequency of track maintenance and replacement programs.

2. Track and turnout maintenance programs involve regularly scheduled maintenance procedures that ensure the rail infrastructure maintains adequate support of the rail traffic while maximizing the service life of the rail infrastructure.

3. The Federal Railroad Administration (FRA) provides minimum Track Safety Standards (TSS). The TSS classifies track solely on the basis of authorized speeds for freight and passenger trains. The only structural or geometry defect that is applicable on excepted track is gauge exceeding 4-feet 10 ¼ inches.

    a. The maximum allowable operating speed of the Port for freight trains is ten (10) miles per hour.

    b. There is no passenger rail service at the Port.

    c. All track and turnouts within the Port are categorized by the FRA TSS as either Excepted or Class I Track.

4. Unsafe Train Operations for FRA Class I Track.

    a. Track Gauge - Standard track gauge is 56 ½ inches measured 5/8 of an inch under the top of the ball of the rail. Wide track gauge is a measurement greater than 58 inches with narrow track gauge any measurement less than 56 inches. The track gauge measurement takes into consideration any movement of the rail in the tie plate when under load. When measurements are beyond these limiting values the track condition is considered unsafe for train operations.

    b. Alignment – A track alignment that has moved from its original uniform position more than five (5) inches in the middle of a sixty-two (62) foot long rail section is considered unsafe for train operations.

    c. Cross-level – The difference between opposing rails shall be zero (0) in tangent and one-half (½) inch in curves that is increased based on train speed and degree of curvature. If the difference in cross-level between any two (2) rails adjacent or within 62 feet of each other (warped) is greater than three (3) inches the condition is considered unsafe for train operations.

    d. Profile – The difference in the top of rail along a sixty-two (62) foot section

greater than three (3) inches the condition is considered unsafe for train operations.

e. Crossties – A minimum of every fourth tie shall be of good sound quality and at least one good crosstie within 48 inches of a rail joint to be considered safe for train operations. Defective crossties lack the qualities to hold track gauge and maintain track surface. The crosstie defects include those that are broken, split, and or deteriorated to where the spike holding capabilities allow over one-half (½) inch of movement in the tie plates or result in measurable plate cutting.

f. Rails Joints – Mismatch rail ends greater than one-quarter (¼) inch shall be corrected.

g. Switch Points – A worn switch point should be replaced if chipped deeper than seven-eights (7/8) inch below the top of the stock rail, three-quarters (¾) inch deep and is longer than four (4) inches, five-eights (5/8) inch deep and longer than seven (7) inches or chipped and has unprotected vertical surface that is five-sixteenths (5/16) inch or wider, three-quarters (3/4) inch below the top of the stock rail for a Samson point. Switch points and stock rails shall be replaced as a complete system.

h. Frog – Frog points chipped, broken or worn more than five-eights (5/8) inch down and six (6) inches back should be replaced.

VI. Recommended Treatments

1. Recommended treatments have been categorized based on industry standard work task items that are applied in maintenance and new construction. The description provides clarity to the circumstances requiring the treatment with a brief scope of work.

No.	Treatment Name	Description
1	Welding/grinding	Component to be cleaned and properly built-up by welding on additional material then grinding to original profile.
2	Surfacing and lining	Correct skewed cross ties. Furnish track ballast, tamp and raise track to restore original or best-fit horizontal and vertical alignment to establish a uniform and smooth rail profile with tie cribs full of track ballast. Switch ties along the length of switch rail and through the limits of the frog may require manual tamping to ensure tie plate is brought up to base of rail with compacted track ballast for support. Surfaced track and turnout(s) shall conform to the standard track ballast section establishing proper shoulders, walkways and broomed clear of debris.
3	Switch point guard	Replace when guard exhibits heavy amount of guard face wear. Install new or adjust switch point guard where switch points show

No.	Treatment Name	Description
		wear within six (6) inches of point of switch. Remove point protector(s) and install switch point guard(s).
4	Turnout maintenance	Replace/tighten missing and loose bolt assemblies, replacing if seized. Properly lubricate switch rail plates and grease switch stand. Tighten connecting rod jam nut. Replace missing/broken cotter keys. Correct switch stand handle position for each movement and ease of throw to establish proper tension on switch points with ordinary effort by a person of average weight. Correct target orientation. Properly crib along the switch rails, connecting rod and switch rods. Remove high spikes, insert treated tie plug and install new spike. Clear all flangeways, base of rails, tie plates and frog toe and heel free of debris. Adjust/tighten rail braces to properly hold and restrain track gauge. Install switch stand lock or hook latch to secure handle position. Crib switch rails.
5	Replace targets	Switch targets to be replaced with reflectorized green (straight movement) and red (diverge movement) targets.
6	Frog replacement	Frog to be replaced with either an SMSG or RBM frog. Guardrails to be included with RBM frogs. Replace all or select frog tie plates.
7	Switch tie renewal	Switch tie renewal shall be performed to maintain 30% or less of defective switch ties or at critical locations where other components are degraded by poor switch tie conditions.
8	Tie plate renewal	Replace deformed, bent, pitted or broken standard tie plates or switch tie plates with properly sized double shoulder tie plates.
9	Replace switch rails	Replace switch points and stocks rails as a set with new or quality relay rail that matches the existing rail, adjacent rails may need to be built up to match replacement rail.
10	Vegetation control	Treat entire track section width with formulated mixture to address seasonal spring growth, heavy woody brush and or general clean-up.
11	Rail relay	Properly disjoint and remove existing rail replacing it with new or quality secondhand AREMA Class I relay of matching size and perform rail end treatment if required.
12	Rail end treatment	Mismatch rail ends exceeding one-sixteenth (1/16) inch or rail end batter rail joints shall be built-up by welding and grinding to provide a smooth surface then cross-slotting closed joints. Rail joint bolt assemblies shall be tightened and replaced if seized. Broken or cracked joint bars to be replaced.
13	Subgrade stabilization	Areas identified from rail profile dips, shallow ballast tie cribs, track pumping, reverse superelevation in curves or high cross-level values shall have the subsurface investigated to determine treatment method (mechanical, chemical or full replacement) based on the soil

No.	Treatment Name	Description
		properties.
14	Geometry reconfiguration	Perform a detailed topographic location survey, engineer a design and stake the reconfiguration, and rehabilitate the track and turnout geometry condition to improve train handling and reduce track maintenance.
15	OTM per standards	Install spikes, rail anchors and bolt assemblies to meet current maintenance or new construction standards.
16	Renew typical section	Remove track section or element to permit excavation of poor in situ subgrade, replace with proper load-bearing fill, place geotextile fabric and geogrid below a sub-ballast layer, pre-ballast, re-install track section and place new track ballast.
17	Replace turnout	Replace entire turnout from the point of switch to the last long tie by removing the existing turnout, excavating to permit a minimum of six (6)-inches of new track ballast below the switch ties, place geotextile fabric and geogrid and pre-ballast, install the new turnout and place new track ballast.
18	Replace guardrail	Remove existing, if present, and install new guardrail.
19	Track ballast renewal	Remove track ballast by cribbing and excavating ballast shoulders or undercutting, placing new track ballast, tamping and surfacing the track.
20	Walkways	Install new or widen existing walkways to meet State and industry standards to provide a safe walking surface for train operators.
21	Out-of-Service	If turnout is out-of-service, it must have a clamp installed on switch points and switch stand locked and tagged. If track is out-of-service, it shall have derail installed with proper warning sign/flag.
22	Replace switch stand	Install new switch stand fully fastened to the headblock switch ties with correct color and properly orientated targets lined for the intended movement.
23	Replace heel block assemblies	Install new heel block assemblies with proper heel block, correct bolts, locking washers and castle head nuts with correct thimbles and cotter keys.
24	Cross/super-elevation	Establish zero (0) cross-level in tangent track and turnouts and calculated or field confirm super-elevation in the outside rail of horizontal curves.
25	Rail/wheel friction control	Install proper gauge face and or top of rail friction modifiers (lubrication) as recommended by a manufacturer based on existing rail wear, train speed, degree of curvature and traffic density.
26	Track maintenance	Replace/tighten missing and loose bolt assemblies, replacing if seized. Replace broken or cracked joint bars. Fully drive rail anchors to correct anchor pattern, replacing if missing, broken or loose. Remove high spikes, insert treated tie plug and install new spike.

No.	Treatment Name	Description
27	Full replacement	Remove existing grade crossing surface and track section to top of sub-ballast, install underdrains if warranted, install new track panel, place track ballast, surface and line track and install new grade crossing surface paving the roadway approaches. Extend crossing surface a minimum of three (3) feet beyond the travel-way.
28	Pavement repair	Remove failed section of pavement and replace with new.
29	Select crossing surface renewal	Replace select failed sections of crossing surface. Replace or repair failed flangeways of crossing surface. Extend crossing surface to extend three (3) feet beyond the travel-way. Repair pavement approaches as may be required.
30	Remove pedestrian crossing	Remove entire pedestrian crossing surface and restore typical track section by performing cross tie renewal, track ballast renewal and surfacing and lining.
31	Modify roadway	Adjust roadway approaches to establish a smooth surface free of humps or dips that meet federal, state and local standards and AREMA recommendations.
32	Track raise	Furnish ballast and raise track profile to meet original design elevation or to provide a smooth vehicle wheel transition from the roadway approach onto the crossing surface.
33	Replace roadway surface	Approach roadway surface to be removed and replaced to establish smooth surface free of humps or dips that meet federal, state and local standards and AREMA recommendations.
34	Realign	Realign track alignment to original design with proper super/cross-level.
35	Maintain track gauge	Re-establish standard track gauge of 56-1/2 inches.
36	Establish drainage	Investigate outfall location and elevations and establish drainage path of surface water to be directed outside the limits of the track section and all four (4) quadrants of a grade crossing. Remove debris blocking, fouling and obstructing the free flow of drainage from the track section.
37	Open tie cribs	Crib select locations to provide an outlet between cross ties to prevent holding water in track section and promote positive drainage.
38	Sign placement	Replace or install new roadway signage with correct signage meeting federal, state and local standards.
39	End of road treatment	Install proper DOT end of road barricades with signs and advance warnings.
40	Train handling	Review switching operation with locomotive engineers in areas with high frequency of engine rail burns and other problematic locations contributing to decreased service life of the rail.
41	Destress rail	Establish rail neutral temperature in jointed or continuously welded rail by allowing proper rail thermal adjustments.

No.	Treatment Name	Description
		Disassemble and lubricate joint bars and establish proper rail joint gap per AREMA recommendations. Properly destress rail per CWR program by adding or removing rail.
42	Anchor pattern	Install rail anchors to achieve every other tie being fully box anchored to decrease longitudinal rail movement (creep).
43	Standard EOT device	Replace and or install new bumping post. Restore earthen mound to standard.
44	Reset direct fixation	Remove existing bolt studs, patch damaged concrete and set new all-thread steel studs with appropriate epoxy.
45	Derail	Install new or adjust derail.
46	Tie renewal	Replace all cross ties throughout grade crossing surface plus ten (10) ties either side of grade crossing surface. Cross tie renewal shall be performed to maintain 30% or less of defective cross ties or at critical locations where other components are degraded by poor cross tie conditions.

VII. Condition Grades – Turnouts

1. Turnout assessments are limited to the components along the switch ties from the point of switch to the last long switch tie. Conditions outside these limits to be evaluated and graded separately.

2. Turnout identification is mapped on Attachment ‘B’ in a general track schematic and Attachment ‘C’ with color coded condition grades assigned.

3. Turnout overall grade condition developed from assessing the turnout as a complete functioning component. The turnout is further separated into four (4) secondary components that include 1) rail (stock, running and closure), 2) switch rails, 3) frog casting and 4) ties. Each of these secondary components are impacted by geometry, tonnage, speed, etc. independently and therefore are assigned grade conditions individually to better understand the overall turnout grade condition. The secondary components are also considered separate major work items typically performed during turnout rehabilitation and maintenance.

4. Switch tie renewals shown as a percentage (%) of total accumulated visible existing switch ties divided by the number of poor/very poor switch ties as observed from the surface. Switch tie quantity does not include any absent switch ties necessary to adhere to any switch tie pattern standard or switch ties covered by debris or those within the limits of a grade crossing surface.

5. Madison Harbor Turnout Table – Summary of Condition Grades.

    a. Turnouts GP-02 to GP-15 are owned and maintained by others and are not included in this summary of condition grades.

Turnout I.D. & Comp.	Grade	Finding Notes	Recommended Treatment
AK-01 Rail Switch Frog Ties	3 3 3 3 18%	1) Loose joint bar assemblies 2) Tie plates broken and worn 3) Switch stand hard to throw, loose jam nut and bolts, lacking proper lubrication/ grease, missing cotter keys, missing roller bolt, switch rod rubbing headblock tie, incorrect normal stand position 4) Diverging side has irregular surface 5) Frog has very poor tie plates 6) Switch point guard absent	1) Welding/grinding 2) Surfacing and lining 3) Switch point guard 4) Tie plate renewal 5) Turnout maintenance
AK-02 Rail Switch Frog Ties	3 3 3 4 20%	1) Alignment hook ahead and behind diverging side 2) Loose joint bar assemblies 3) Switch stand moderate throw, lacking proper cribbing, incorrect normal movement target color, incorrect normal stand position, loose jam nut and switch rail bolts, missing cotter keys and switch rail bolts 4) Frog guard rail flangeway obstructed with heavy wear 5) Curve alignment extends onto switch points causing severe switch rail wear 6) Turnout located within a grade crossing surface 7) Frog point chipped and deformed	1) Surfacing and lining 2) Turnout maintenance 3) Replace targets 4) Welding/grinding 5) Frog replacement 6) Switch point guard 7) Replace switch rails
AK-03 Rail Switch Frog Ties	3 3 4 3 23%	1) Rail has flow and flat spot marks 2) High spikes 3) Normal movement has white target 4) Switch rail chipped and worn with heavy wear on switch point guard and loose heel bolts, missing cotter keys 5) Frog has chipped point with moderately worn guard rail face 6) Switch stand loose from very poor headblock ties 7) Switch point guard absent	1) Switch point guard 2) Replace switch rails 3) Replace targets 4) Welding/grinding 5) Switch tie renewal 6) Turnout maintenance
AK-04 Rail Switch Frog Ties	3 3 2 2 32%	1) High spikes 2) Switch panel incorrect normal movement target color, missing and loose heel bolts, switch panel skewed, right switch rail is chipped 3) Rail has chipped ends at rail joints 4) Switch point guard heavily worn	1) Welding/grinding 2) Switch point guard 3) Turnout maintenance 4) Switch tie renewal 5) Surfacing and lining 6) Replace targets
AK-05	3	1) Switch panel has loose rail braces, incorrect normal stand position	1) Turnout maintenance 2) Switch tie renewal

Turnout I.D. & Comp.	Grade	Finding Notes	Recommended Treatment
Rail Switch Frog Ties	3 2 2 39%		
PH-01 Rail Switch Frog Ties	2 3 2 2 0%	1) Switch panel lacking proper cribbing, loose heel bolts, rail braces and jam nut, missing cotter keys 2) Switch point guard absent 3) Derail should be installed to protect Track C19(B) through rail traffic	1) Switch point guard 2) Turnout maintenance 3) Derail
PH-02 Rail Switch Frog Ties	2 3 2 2 0%	1) Switch panel lacking proper cribbing, loose jam nut and heel bolts 2) Switch point guard absent	1) Switch point guard 2) Turnout maintenance
GP-01 Rail Switch Frog Ties	2 2 2 2 0%	1) Switch panel lacking proper lubrication/grease	1) Turnout maintenance
SB-01 Rail Switch Frog Ties	4 4 2 2 30%	1) Joint bar assembly loose and broken 2) Switch stand non-functional with incorrect normal movement target color 3) Switch panel lacking proper lubrication/grease, loose jam nut, missing cotter keys, broken heel block with loose bolts 4) Moderate vegetation 5) Turnout located within a grade crossing surface 6) Switch point is not clamped and switch stand is not locked 7) Switch point guard absent	1) Switch point guard 2) Vegetation control 3) Turnout maintenance 4) Replace switch stand 5) Replace heel block assembly 6) Out-of-service 7) Replace targets 8) Replace heel block assemblies
SH-01 Rail Switch Frog Ties	3 3 2 3 4%	1) Profile dip ahead of the switch 2) High spikes 3) Switch panel lacking proper cribbing, loose rail braces 4) Frog point has flow 5) Turnout located within a grade crossing surface	1) Surfacing and lining 2) Welding/grinding 3) Turnout maintenance
SH-02 Rail	2 3	1) Switch panel lacks proper cribbing and lubrication/grease, incorrect normal switch stand position	1) Welding/grinding 2) Vegetation control 3) Switch point guard

Turnout I.D. & Comp.	Grade	Finding Notes	Recommended Treatment
Switch Frog Ties	2 3 0%	2) Turnout located within a grade crossing surface 3) Light vegetation 4) Frog point chipped and deformed 5) Fouled track ballast near grade crossing surface 6) Heavy wear on guardrail 7) Switch point guard absent	4) Turnout maintenance 5) Track ballast renewal
SH-03 Rail Switch Frog Ties	2 3 2 3 6%	1) Profile dip ahead of turnout 2) Light vegetation 3) Curve closure rail has one-eight (1/8) inch worn gauge face wear with other rail spalling marks 4) Joint bar assembly loose bolts 5) High spikes 6) Switch panel lacking proper cribbing, lubrication/ grease with incorrect normal stand position and loose heel block bolts 7) Frog has chipped and worn point with loose bolts and heavily worn guardrail 8) Alignment swing between SH-02 and SH-03 9) Right stock rail split longitudinally with measurable rail flow and spalling	1) Turnout maintenance 2) Welding/grinding 3) Vegetation control 4) Rail relay 5) Replace switch rails 6) Realign 7) Surfacing and lining
SH-04 Rail Switch Frog Ties	3 3 3 3 9%	1) Switch panel has incorrect diverging movement target color and stand not fully fastened 2) Rail has engine burns and flat spots 3) Frog point deformed and chipped 4) Alignment swing through switch panel 5) Rail flow on switch rail impeding proper closure of Samson switch points 6) Left switch point is chipped	1) Welding/grinding 2) Replace targets 3) Surfacing and lining 4) Turnout maintenance 5) Realign
SH-05 Rail Switch Frog Ties	2 2 2 3 5%	1) Switch panel has incorrect normal stand position 2) Joint bar installed incorrectly 3) Alignment hook along diverge side 4) Frog deformed	1) Welding/grinding 2) Surfacing and lining 3) Turnout maintenance
SH-06 Rail Switch Frog Ties	5 3 5 4 20%	1) Swing along and behind straight side with switch panel in a profile dip 2) Rail has visible flat spots, flow and engine burns 3) Rail joints have mismatch and closed joints 4) High spikes 5) Switch panel has incorrect normal stand	1) Surfacing and lining 2) Turnout maintenance 3) Welding/grinding 4) Vegetation control 5) Rail end treatment 6) Replace switch rails

Turnout I.D. & Comp.	Grade	Finding Notes	Recommended Treatment
		position, targets installed incorrectly, rail does not rest on plates 6) Frog is deformed 7) Moderate vegetation 8) Right switch and stock rail worn with switch point chipping and preventing full closure	
SH-07 Rail Switch Frog Ties	2 3 2 2 4%	1) Loose joint bars 2) High spikes 3) Switch panel has loose rail braces, missing cotter keys 4) Moderate vegetation 5) Switch point guard in poor condition with heavy wear 6) Mismatched rail ends	1) Turnout maintenance 2) Vegetation control 3) Switch point guard 4) Rail end treatment
SH-08 Rail Switch Frog Ties	2 2 2 2 19%	1) Alignment swing ahead of switch 2) Switch panel switch rails do not contact base plate, incorrect targets, loose jam nut 3) Turnout located within a grade crossing surface 4) Guardrail flangeways obstructed 5) Switch point is not clamped and switch stand is not locked and lined for normal movement only since Turnout SB-01 is out of service	1) Surfacing and lining 2) Replace targets 3) Turnout maintenance 4) Out-of-service (diverging movement)
SH-09 Rail Switch Frog Ties	3 3 2 2 12%	1) Alignment swing behind diverging movement 2) Switch rails do not contact plates, lack proper cribbing, incorrect targets and normal stand position 3) Turnout located within a grade crossing surface	1) Surfacing and lining 2) Turnout maintenance 3) Replace targets
SH-10 Rail Switch Frog Ties	3 3 2 3 10%	1) Switch panel lacks proper cribbing 2) Frog deformed and chipped 3) Light vegetation 4) Guardrail flangeways obstructed 5) Turnout located within a grade crossing surface	1) Welding/grinding 2) Turnout maintenance 3) Vegetation control
SH-11 Rail Switch Frog Ties	2 3 2 2 0%	1) Profile dip ahead/along switch panel and behind both legs of the turnout resulting in shallow ballast 2) High spikes 3) Turnout located within a grade crossing surface 4) Switch panel incorrect target color, loose jam nut, narrow gap in switch points 5) Rail has series of minor engine burns (wheel	1) Switch point guard 2) Surfacing and lining 3) Turnout maintenance 4) Subgrade stabilization 5) Replace targets

Turnout I.D. & Comp.	Grade	Finding Notes	Recommended Treatment
		slippage on diverging movement) 6) Switch point guard absent	
SH-12 Rail Switch Frog Ties	2 2 2 2 2%	1) Alignment swing on diverge side 2) Profile dip ahead and behind both legs of the turnout resulting in shallow ballast 3) Switch point guard has heavy wear	1) Surfacing and lining 2) Switch point guard 3) Subgrade stabilization
SH-13 Rail Switch Frog Ties	4 4 3 4 20%	1) High spikes 2) Every 4th tie anchored, should be fully anchored 3) Switch panel lacking proper cribbing, target partially damaged, incorrect normal stand position, missing cotter keys 4) Switch point guard has heavy wear 5) Frog casting smashed causing heavy flow with flange chipped with evidence of metal shavings 6) Right stock and curved closure rail heavily worn gauge face due to curvature ahead of turnout	1) OTM per standard 2) Switch point guard 3) Replace target 4) Replace switch rails 5) Welding/grinding 6) Replace frog 7) Rail relay 8) Turnout maintenance
SH-14 Rail Switch Frog Ties	3 3 2 2 0%	1) Minor rail end batter at rail joints 2) Mismatched rail ends 3) Switch panel has incorrect target colors	1) Rail end treatment 2) Replace targets
SH-15 Rail Switch Frog Ties	2 1 2 2 3%	1) Alignment swing behind straight side 2) Switch panel has loose roller wheel, lacking proper cribbing 3) Moderate vegetation 4) Turnout located within a grade crossing surface 5) Mismatch rail ends at heel and frog 6) Shallow tie cribs 7) Sink hole in southeast quadrant of grade crossing	1) Surfacing and lining 2) Turnout maintenance 3) Vegetation control 4) Rail end treatment 5) Subgrade stabilization
SH-16 Rail Switch Frog Ties	2 1 2 2 0%	1) Shallow tie cribs 2) Switch panel lacking proper cribbing, incorrect bolt position on connecting rod, loose switch rod connection at switch rail 3) Sinkhole near toe of frog and turnout PI along diverging side 4) Light vegetation 5) Rail has engine burns	1) Surfacing and lining 2) Turnout maintenance 3) Subgrade stabilization 4) Vegetation control

Turnout I.D. & Comp.	Grade	Finding Notes	Recommended Treatment

6. Granite City Harbor Turnout Table – Summary of Condition Grades.

   a. Turnouts NH-10, NH-14 to NH-15 and NH-17 to NH-35 are owned and maintained by others and are not included in this summary of condition grades.

Turnout I.D.	Grade	Finding Notes	Recommended Treatment

Turnout I.D.	Grade	Finding Notes	Recommended Treatment
NH-01 Rail Switch Frog Ties	3 3 2 3 40%	1) Light vegetation 2) Rail has flow and is chipped with tight joints 3) Switch panel has moderate throw lacks proper lubrication/grease and cribbing with loose heel bolts and rail braces, cotter keys not properly bent, rail at heel blocks not properly aligned in the normal position 4) Switch stand loose from very poor headblock ties 5) Frog has worn and deformed point and wing rail with loose bolts 6) Switch point guard absent	1) Switch point guard 2) Turnout maintenance 3) Vegetation control 4) Switch tie renewal 5) Welding/grinding 6) Rail end treatment
NH-02	N/A	1) Removed from service	1) None
NH-03 Rail Switch Frog Ties	3 4 3 3 28%	1) Profile drops behind diverging side 2) Moderate vegetation 3) Rail has flow, spalling and flat spots with partial anchor pattern and pitted tie plates 4) Switch panel has easy throw, lacks proper lubrication/grease, cribbing and switch point guard with loose rail braces 5) Frog has chip wing rail and worn point with loose bolts	1) Switch point guard 2) Surfacing and lining 3) Turnout maintenance 4) Welding/grinding 5) Vegetation control 6) Tie plate renewal 7) OTM per standard
NH-04	N/A	1) Removed from service	None
NH-05 Rail Switch Frog Ties	3 3 2 2 5%	1) Irregular profile behind diverging side 2) Light vegetation 3) Rail has flow/lip and mismatch at the frog 4) Switch panel has moderate throw lacks proper lubrication/grease and cribbing with switch point not contacting base plate	1) Turnout maintenance 2) Vegetation control 3) Surfacing and lining 4) Rail end treatment
NH-06 Rail Switch Frog Ties	4 3 4 4 35%	1) Rail has flow/lippage 2) Turnout tie plates in very poor condition worn, broke and pitted 3) Switch panel has hard throw lacks proper grease and cribbing 4) Switch point guard heavily worn 5) Heel and frog bar assemblies loose 6) Frog is severely deformed with supporting HTTP in very poor condition 7) Improper switch rail tie plates	1) Turnout maintenance 2) Switch point guard 3) Frog replacement 4) Tie plate renewal 5) Switch tie renewal
NH-07 Rail Switch	4 3 2	1) Alignment has a swing ahead and behind the straight side and a hook behind the diverge side, generally the turnout lays like an irregular equilateral turnout	1) Switch point guard 2) Turnout maintenance 3) Geometry reconfiguration

Turnout I.D.	Grade	Finding Notes	Recommended Treatment
Frog Ties	3 31%	2) Rail has flow, spalling, and engine burns 3) Tie plates are worn and pitted 4) Point protector installed 5) Switch panel has a moderate throw, lacking hook/lock on stand, incorrect normal stand position, loose heel bolts and rail braces 6) Frog has loose bolts	4) Tie plate renewal 5) Surfacing and lining
NH-08 Rail Switch Frog Ties	4 3 3 5 10%	1) Rail has chip, engine burn and spalling marks with loose joint bar assemblies and no rail gaps 2) Tie plates are in poor condition 3) Switch panel lacking proper grease with hard throw and hook/lock absent 4) Switch point worn 5) Frog point, wing rail and throat severely deformed and chipped with rail ends mismatched and loose bolts 6) Gauge plate missing proper fasteners 7) Rail from point of and behind frog on diverge movement has heavy gauge face wear from reverse curve layout of crossover movement 8) Switch point guard absent	1) Turnout maintenance 2) Switch point guard 3) Frog replacement 4) Welding/grinding 5) Rail end treatment 6) Geometry reconfiguration 7) Rail relay 8) Surfacing and lining 9) Tie plate renewal Or 10) Turnout replacement
NH-09 Rail Switch Frog Ties	4 3 4 3 30%	1) Switch panel lacking proper lubrication/ grease and stand not fully fastened, loose rail braces 2) Right switch rail severely worn and gapped from possible weld build-up 3) Heel bar assemblies loose 4) Frog point and wing rails worn 5) Debris in guardrail flangeway 6) Switch point guard absent	1) Turnout maintenance 2) Replace switch rails 3) Switch point guard 4) Welding/grinding
NH-11 Rail Switch Frog Ties	3 2 2 2 20%	1) Light vegetation 2) Rail has engine burn and flow/lippage 3) Switch panel lacking proper lubrication/grease with moderate throw, hook absent, lacking proper cribbing, loose rail braces 4) Heel bar assemblies loose 5) Frog wing rail worn/deformed with moderate wear on guardrail gauge face 6) Rail end mismatch at heel block 7) Switch point guard absent	1) Vegetation control 2) Switch point guard 3) Turnout maintenance 4) Welding/grinding 5) Rail end treatment
NH-12 Rail Switch	2 3 3	1) Rail has measurable flow with excessive spalling along closed curvature 2) Switch panel lacking proper lubrication/ grease, absent with loose rail braces	1) Turnout maintenance 2) Welding/grinding 3) Switch point guard

Turnout I.D.	Grade	Finding Notes	Recommended Treatment
Frog Ties	2 20%	3) Loose heel and frog bolts 4) Switch and frog points worn 5) Switch point guard absent	
NH-13 Rail Switch Frog Ties	4 4 3 4 75%	1) Dip in track profile ahead of turnout 2) Rail has worn gauge face with high slant along curved closure and opposing rail with excessive flow 3) Fouled ballast with pumping and top surface covered 4) Joint, heel, and frog bar assemblies broken, missing and loose bolts with no gap (tight) 5) High spikes 6) Switch panel lacking proper cribbing, lubrication/ grease, hook absent with incorrect normal stand position and loose rail braces 7) Frog point heavily worn with casting broke at toe at curved closure rail 8) Rail anchors absent 9) Switch point guard absent	1) Switch tie renewal 2) OTM per standards 3) Turnout maintenance 4) Welding/grinding 5) Surfacing and lining 6) Switch point guard 7) Renew typical section 8) Subgrade stabilization 9) Track ballast renewal 10) Frog replacement Or 11) Replace turnout
NH-16 Rail Switch Frog Ties	3 4 3 3 55%	1) Alignment swing ahead of switch and behind straight side of frog 2) Rail has flow, top worn and gauge side angle worn (curved closure rail) 3) Joint bar assemblies loose 4) No anchors installed 5) Tie plates heavily worn, pitted and bent 6) Switch panel has loose/missing switch rail bolts, stand has no targets or latch/lock, jam nut loose, bolts incorrect in rods, lacking proper lubrication/grease and cribbing, loose heel bolts and rail braces 7) Frog has deformed, chipped and worn point 8) Track ballast is fouled 9) High spikes	1) Rail relay 2) Welding/grinding 3) Turnout maintenance 4) Surfacing and lining 5) Replace targets 6) OTM per standards 7) Tie plate renewal 8) Track ballast renewal 9) Switch tie renewal
NH-36 Rail Switch Frog Ties	3 3 3 3 4%	1) Rail has measurable flow 2) Track ballast shallow 3) Single shoulder tie plates used in poor condition 4) Switch panel hard to throw, missing targets, loose jam nut, stand not fully fastened, lacking proper cribbing, lubrication/ grease and loose rail braces 5) Heel block assemblies loose and missing	1) Turnout maintenance 2) Welding/grinding 3) Surfacing and lining 4) Replace targets 5) Replace guardrail 6) Replace switch rails 7) Tie plate renewal

Turnout I.D.	Grade	Finding Notes	Recommended Treatment
		6) Switch point worn and not contacting base plate 7) Frog wing rail worn and deformed with heavy wear on guardrail gauge face with flangeway obstructed 8) Right hand switch rail missing bolts and has broken base, left hand switch rail has vertical split in rail head 9) High spikes	
PP-01 Rail Switch Frog Ties	3 3 4 2 27%	1) Profile dip between the heel and frog 2) Light vegetation 3) Rail has measurable flow 4) Shallow ballast cribs 5) Switch panel hard to throw, incorrect fasteners at switch stand, lacking proper lubrication/grease, loose heel bolts and rail braces 6) Switch point severely worn 7) Switch point guard absent 8) Walkway surface absent	1) Replace switch rails 2) Turnout maintenance 3) Vegetation control 4) Surfacing and lining 5) Switch point guard 6) Walkways
PP-02 Rail Switch Frog Ties	3 3 3 2 27%	1) Profile dip behind diverge side 2) Moderate vegetation 3) Track ballast shoulder absent 4) Rail has measurable flow 5) High spikes 6) Tie plates are pitted 7) Switch panel hard to throw, lacking proper lubrication/grease, loose heel bolts and rail braces, switch rail does not contact base plates 9) Switch point guard absent 10) Walkway surface absent	1) Switch point guard 2) Turnout maintenance 3) Vegetation control 4) Surfacing and lining 5) Walkways 6) Tie plate renewal

VIII. Condition Grades – At-Grade Vehicular Crossings

1. At-grade vehicular crossing assessments were limited to the length of the grade crossing surface from end to end and approximately four (4) feet outside from the near rail along the roadway surface unless these are multiple tracks than roadway surface assessed to four (4) feet outside from the near rail of the outer tracks. Conditions outside these parameters to be evaluated and graded separately as either track, turnouts or roadway surface. The roadway surface assessment is being performed by Juneau Associates and it not included in this report.

2. At-grade vehicular crossing identification is mapped on Attachment ‘B’ in a general track schematic, Attachment ‘C’ with color coded condition grades assigned and

Attachment 'D' on an aerial background with DOT/AAR crossing number.

3. Tenant installed at-grade vehicular crossings and or landing pads have not been included in this assessment.

4. Active grade crossing signals that exist are not being assessed in this report. It is recommended that before any active grade crossing signal work is considered that a formal road diagnostic is performed with the Illinois Commerce Commission (ICC) and other regulatory agencies. This work would include any modifications to the existing or installation of new active grade crossing signals.

5. Madison Harbor At-Grade Vehicular Crossing Table – Summary of Condition Grades.

   a. At-grade vehicular crossings 12 and 32 to 33 are owned and maintained by others and are not included in this summary of condition grades.

Grade Crossing I.D.	Grade	Finding Notes	Recommended Treatment
10	4	1) Rail has flow and is heavily worn 2) Crossing timbers are heavily decayed with loss of material 3) Loose joint bar within crossing limits 4) Located within a turnout	1) Full replacement
11	3	1) Rail is moderately worn with flow and gauge face wear 2) Asphalt along southern track south approach has failed along the field side of the rail.	1) Pavement repair
12	N/A	1) Highway overpass	None
13	3	1) Loose crossing timbers under vehicle traffic 2) Pedestrian crossing not connected to sidewalks 3) Minor hump in south roadway approach	1) Select crossing surface renewal 2) Remove pedestrian crossing 3) Modify roadway
14	1	1) Pedestrian crossing not connected to sidewalks	1) Remove pedestrian crossing
15	3	1) Track profile 1"-2" lower than roadway approaches 2) Early indications of isolated pavement failure depressed at ends of crossing surface 3) Early indications of uneven wear on low and high rail 4) Inconsistent track gauge measures from 56-1/2 to 57-1/4 in sharp horizontal curve	1) Track raise 2) Replace roadway surface 3) Realign 4) Maintain track gauge
16	1	1) Track profile 1"-2" lower than roadway approaches	1) Track raise 2) Vegetation control

Grade Crossing I.D.	Grade	Finding Notes	Recommended Treatment
		2) Light vegetation	
17	1	1) Light vegetation	1) Vegetation control
18	2	1) Track profile 3”-4” lower than east concrete roadway approach. 2) Track settlement indications along SL#1 and SL#2 in comparison to track approaches 3) Light vegetation 4) Fouled track ballast with fines/sand at ends of crossing surface indicating poor drainage	1) Track raise 2) Subgrade stabilization 3) Establish drainage 4) Open tie cribs 5) Vegetation control
19	3	1) Rail has flow 2) Track ballast fouled along north approach from roadway surface with water falling into both track approaches 3) Incorrect advancing warning signs installed on both approaches, W10-12L sign should replace W10-12R sign 4) Superelevation performing well through curved crossing 5) Rubber flangeways have been damaged on concrete panels 6) Great Plains West Lead track profile sunken approximately 1”-2” with quick rise into the higher east track approach (derail), undercutting of private track recommended to maintain flat roadway profile across at-grade vehicular crossing 7) North Loop track profile sunken 3”-4” with notable distinction located at the east track approach	1) Establish drainage 2) Open tie cribs 3) Sign placement 4) Select crossing surface renewal 5) Track raise
20	5	1) Rail has flow 2) Crossing timbers have severe deterioration 3) Light vegetation	1) Vegetation control 2) Select crossing surface renewal
21-ML	3	1) Moderate vegetation 2) Rail is curve worn and has flow 3) Joint bar assembly loose	1) Vegetation control 2) Track maintenance
21-NL	5	1) Crossing surface removed with roadway approaches intact 2) Moderate vegetation 3) Joint bar assembly loose 4) Rail has spalling, flow and flat spot marks with heavy top and gauge side wear indicators	1) End of road treatment 2) Rail relay 3) Rail/wheel friction control 4) Vegetation control 5) Track maintenance
22A	1	1) Concrete panels have minor irregular surface	1) None

Grade Crossing I.D.	Grade	Finding Notes	Recommended Treatment
		caused by manufacturing/installation defect	
22B	4	1) Light vegetation 2) Crossing timbers have severe deterioration	1) Vegetation control 2) Select crossing surface renewal
23A	1	1) Concrete panels have minor irregular surface caused by manufacturing/installation defect	None
23B	4	1) Light vegetation 2) Crossing timbers have severe deterioration 3) Pedestrian crossing not connected to sidewalks 4) Narrow track gauge	1) Vegetation control 2) Select crossing surface renewal 3) Remove pedestrian crossing 4) Maintain track gauge
24	2	1) Early indications of isolated pavement failure on roadway approaches and through crossing 2) Light vegetation	1) Vegetation control
25	2	1) Light vegetation	1) Vegetation control
26 -SL#1	4	1) Profile has a dip primarily located on the southern half (eastbound lane) 2) Crossing is receiving heavy wheel impact on the eastbound lane approach as tractor trailers decelerate approaching the crossing with limited sight distance along the track approaches from buildings and stored rail cars 3) Rail is in good condition and can be reused	1) Full replacement 2) Subgrade stabilization 3) Track raise
26 -SL#2	3	1) None	None
26 -SL#3	5	1) Profile has a dip primarily located on the northern half (westbound lane) 2) Establish ditch section along track from crossing in northeast quadrant to culvert inlet 3) Crossing is receiving heavy wheel impact on the westbound lane approach as tractor trailers decelerate approaching the crossing with limited sight distance along the track approaches from buildings and stored rail cars 4) Rail is in good condition and can be reused	1) Full replacement 2) Subgrade stabilization 3) Establish drainage 4) Track raise
27	1	1) None	None
28	2	1) Early indications of pavement failure (depressed, transverse cracks) on roadway approaches and through crossing 2) Track profile 1” lower than roadway approaches	1) Modify roadway 2) Track raise 3) Vegetation control

Grade Crossing I.D.	Grade	Finding Notes	Recommended Treatment
		3) Minor hump in west roadway approach 4) Light vegetation 5) Roadway approaches require milling and re-surfacing	
29	3	1) All four quadrants covered with embankment material and vegetation 2) High rail has severe gauge face wear 3) With rail and track ballast conditions it is assumed ties are in poor condition 4)Wide track gauge 5) Track profile 2” lower than roadway approaches possibly from poor subgrade conditions	1) Establish drainage 2) Rail relay 3) Tie renewal 4) Subgrade stabilization 5) Open tie cribs 6) Track raise 7) Realign 8) Maintain track gauge 9) Vegetation control
30	2	1) Early indications of isolated pavement failure at south end of crossing surface	None
31	1	1) Engine burns on WRHS#1 multiple locations	1) Train handling
34	1	1) Minor heaving in roadway approach north end	1) Modify roadway
35	2	1) The north roadway approach is steep and could create a high-centering situation for long wheelbase vehicles or trailers with low ground clearance condition 2) W10-5 and W10-5P (Low Ground Clearance Grade Crossing) signs are warranted	1) Sign placement

6. Granite City Harbor At-Grade Vehicular Crossing Table – Summary of Condition Grades.

   a. At-grade vehicular crossings 4 to 9 are owned and maintained by others and are not included in this summary of condition grades.

Crossing I.D.	Grade	Finding Notes	Recommended Treatment
1	3	1) Track profile 1”-2” lower than roadway approaches 2) Irregular roadway surface between tracks 3) No roadway shoulders present	1) Track raise 2) Modify roadway 3) Select crossing surface renewal
2	4	1) High rail has severe gauge face wear from incorrect super-elevation and inconsistent horizontal curvature 2) Track pumping, loose gauge rod, high spikes and wide track gauge 3) Crossing timbers have severe deterioration 4) Minor hump in north roadway approach	1) Full replacement 2) Subgrade stabilization 3) Modify roadway 4) Realign 5) Maintain track gauge

Crossing I.D.	Grade	Finding Notes	Recommended Treatment
		5) High potential for out of cross level under traffic load 6) Inconsistent track gauge measures from 56-7/8 to 57-3/16 in sharp horizontal curve	
3	1	1) Underdrains not visible 2) ENS and advance warning signs absent	1) Establish drainage 2) Sign placement

IX. Condition Grades – Track

1. Track assessments were limited to the areas beyond any specialty trackwork elements including at-grade vehicular crossings, rail crossings, turnouts and direct fixation elements. Conditions within these specialty trackwork elements have been evaluated and graded separately.

2. Track section identification is mapped on Attachment 'C' with color coded condition grades assigned.

3. The assigned track Grades account for observed track usage that includes rail car storage, inbound/outbound movement, throughfare and intra-plant switching. The lowest track Grade within a section of track is provided in the table. This track Grade may not represent the track Grade of the entire section assessed and may only be assigned to a small portion of the particular track section.

4. Madison Harbor Track Table – Summary of Condition Grades.

Track Section I.D.	Grade	Finding Notes	Recommended Treatment
C-19 (A) Ties	4 40%	1) Rail has flow, flat spots, curve worn ¼ inch, spalling, shelling, engine burns 2) Loose joint bars 3) Gauge rods installed every 5th tie in curve 4) Shallow ballast and skewed ties 5) Rail end batter 6) Profile is in a dip with a alignment hook into the grade crossing	1) Rail relay 2) Track maintenance 3) Rail/wheel friction control 4) Cross/super-elevation 5) Surfacing and lining 6) Tie renewal 7) Rail end treatment
C-19 (B) Ties	2 30%	1) Rail has flow up to ¼ inch, engine burns, spalling 2) Missing anchors 3) Reverse superelevation ½ inch 4) Rail end batter	1) Surfacing and lining 2) OTM per standards 3) Rail end treatment
C-18 (A) Ties	3 50%	1) Alignment is irregular and twisted profile with low spots 2) Heavily worn 8-inch single shoulder tie plates	1) Surfacing and lining 2) Rail relay 3) OTM per standards

Track Section I.D.	Grade	Finding Notes	Recommended Treatment
		3) Gauge rods installed in curves 4) Toed joint bars loose/missing bolt assemblies 5) Rail 90lb rail dated 1907 has gauge face wear, rail end batter, spalling, shelling, corrugations, flow 6) Mismatched rail ends 7) Reverse ¼" superelevation in curve near AK-03	4) Cross/super-elevation 5) Tie renewal 6) Tie plate renewal 7) Rail end treatment
C-19L (A) Ties	2 20%	1) Zero superelevation in curve 2) Light gauge face wear on outside rail with head checks, inside rail has flow, rail end batter	1) Cross/super-elevation 2) Rail end treatment
C-18L (A) Ties	2 0%	1) None	None
C-18L (B) Ties	3 10%	1) Profile is low with an isolated hump area 2) Rail has ¼ inch gauge face wear on outside rail and flat spots with flow on inside rail from incorrect superelevation 3) Light vegetation	1) Rail/wheel friction control 2) Rail relay 3) Cross/super-elevation 4) Surfacing and lining 5) Vegetation control
PH-01 (A) Ties	2 0%	1) None	None
PH-01 (B) Ties	2 0%	1) None	None
PH-02 (A) Ties	2 0%	1) None	None
NL (A) Ties	2 20%	1) Profile has a hump and dips, low near east approach to Grade Crossing #15 2) Poor profile transition to rail direct fixation and Grade Crossing #15 3) Inside rail on curves has flow 4) Rail has engine burns 5) Select areas with shallow tie cribs	1) Surfacing and lining
NL (B) Ties	3 30%	1) Alignment is irregular with some swings and profile dips 2) Light vegetation 3) Empty tie cribs at joint bars 4) Very poor subgrade (sinkhole) in curve near SL-01 resulting in no ballast shoulders, empty tie cribs for approximately 50 feet, and ¼ inch gauge	1) Vegetation control 2) Surfacing and lining 3) Subgrade stabilization

Track Section I.D.	Grade	Finding Notes	Recommended Treatment
		face wear on outside curve rail	
NL (C) Ties	4 70%	1) Light vegetation 2) Poor tie condition causing twisted irregular alignment 3) Rail has gauge face wear	1) Vegetation control 2) Surfacing and lining 3) Tie renewal
NL (D) Ties	4 40%	1) Curve is pushing outward causing rail kink at joints 2) Rail has 1/8 inch gauge face wear 3) Light vegetation	1) Vegetation control 2) Surfacing and lining 3) Tie renewal 4) Destress rail
NL (E) Ties	2 40%	1) Loose joint bars 2) New light vegetation growing below previously sprayed dead vegetation 3) Profile generally low could be raised 1 inch 4) Skewed cross ties 5) Rail has signs of being in state of compression	1) Vegetation control 2) Track maintenance 3) Surfacing and lining 4) Destress rail 5) Tie renewal
NL (F) Ties	4 10%	1) Track section between rail crossings has ¼ inch gauge face wear on outside rail with 5/8 inch super-elevation 2) Skewed cross ties 3) Super-elevation generally ¼ inch 4) Inside rail has flow and flat spots, outside rail has 5/16 inch gauge face wear 5) Every 4th tie box anchored 6) Light vegetation	1) Rail/wheel friction control 2) Rail relay 3) Cross/super-elevation 4) Surfacing and lining 5) Vegetation control 6) OTM per standards
SL#1 (A) Ties	1 10%	1) Rail creeping/pushing south creating voids in tie cribs 2) Light vegetation	1) Surfacing and lining 2) Anchor pattern 3) Vegetation control
SL#1 (B) Ties	2 20%	1) Skewed ties with rail creeping/pushing south creating voids in tie cribs 2) Anchor pattern every 3rd tie 3) Walkway gradation track ballast broken down with heavy volume of fines considered fouled with poor drainage qualities 4) Moderate vegetation 5) Alignment has 7/8 inch superelevation in the curve with 56-7/8 inch track gauge 6) Joint bars show ¼ inch of rail movement	1) Surfacing and lining 2) Anchor pattern 3) Vegetation control 4) Destress rail 5) Walkways
SL#1 (C) Ties	2 10%	1) Fines from Warehouse Building downspouts and roadway surface fouling track ballast 2) Sinkhole on east side of track for 15 track feet between SL#1 and SL#2 3) Profile dip in Grade Crossing #26	1) Establish drainage 2) Surfacing and lining 3) Subgrade stabilization 4) Track ballast renewal

Track Section I.D.	Grade	Finding Notes	Recommended Treatment
SL#1 (D) Ties	1 20%	1) Alignment in curve is pushed outward on approaches to Rail Crossing #1 with a profile hump between Turnout SL-08 and SL-09 2) Rail Crossings in a depression with fouled track ballast 3) Light vegetation	1) Surfacing and lining 2) Vegetation control 3) Track ballast renewal 4) Destress rail
SL#1 (E) Ties	2 0%	1) Light vegetation 2) Rail alignment is 7/8 inch out of cross level (high west rail) behind Turnout SH-16	1) Surfacing and lining 2) Subgrade stabilization 3) Vegetation control 4) Cross/super-elevation
SL#2 (A) Ties	1 0%	1) Skewed ties with rail creeping/pushing south creating voids in tie cribs 2) Anchor pattern every 3rd tie	1) Surfacing and lining 2) Anchor pattern 3) Destress rail
SL#2 (B) Ties	1 10%	1) Skewed ties with rail creeping/pushing south creating voids in tie cribs 2) Anchor pattern every 3rd tie 3) Dip in Crossing #26 4) Alignment has 7/8 inch superelevation in the curve with 56-7/8 inch track gauge 5) Track ballast shoulders are slightly low	1) Surfacing and lining 2) Anchor pattern 3) Destress rail 4) Cross/super-elevation
SL#2 (C) Ties	1 0%	1) Sink hole between SL#2 and SL#3 with no track ballast shoulders on SL#2 for 10 track feet	1) Surfacing and lining 2) Subgrade stabilization 3) Track ballast renewal
SL#3 (A) Ties	4 0%	1) Alignment has a 50 foot misalignment and reduced superelevation from ½ inch to ¼ inch	1) Destress rail 2) Surfacing and lining 3) Cross/super-elevation
SL#3 (B) Ties	1 0%	1) Skewed ties with rail creeping/pushing south creating voids in tie cribs 2) Anchor pattern every 3rd tie 3) Dip in Grade Crossing #26 4) Poor drainage with fines in track ballast approach to Grade Crossing #26 5) Alignment has 3/8 inch superelevation in the curve with 57 inch track gauge 6) Light vegetation 7) Track ballast shoulders are slightly low	1) Surfacing and lining 2) Anchor pattern 3) Establish drainage 4) Vegetation control 5) Destress rail 6) Track ballast renewal 7) Cross/super-elevation
SL#3 (C) Ties	1 0%	1) Sink hole between SL#2 and SL#3 with no track ballast shoulders on SL#2 for 10 track feet 2) Dip in Grade Crossing #26	1) Surfacing and lining 2) Subgrade stabilization 3) Track ballast renewal
GPW (A) Ties	3 50%	1) Profile has a hump between Grade Crossing #19 and Grade Crossing #32 with a depression in and from Grade Crossing #19 to Turnout GP-01	1) Surfacing and lining 2) Vegetation control 3) Cross/super-elevation

Track Section I.D.	Grade	Finding Notes	Recommended Treatment
		2) Light vegetation 3) Rail has 1/8 inch flow on outside rail 4) Alignment has ¼ inch reverse superelevation near Turnout GP-01	4) Tie renewal
GPE (A) Ties	3 20%	1) Alignment has ¾ inch reverse superelevation near Turnout SL-09 at Point of Curve 2) Light vegetation 3) Rail on inside of curve has 1/16 inch flow with outside rail having top wear	1) Surfacing and lining 2) Vegetation control 3) Cross/super-elevation
BD#1 (A) Ties	2 10%	1) Rail end batter 2) Both rails have flow 3) Sinkhole 10 feet along west rail near Warehouse Building #1 wall marker #4	1) Rail end treatment 2) Subgrade stabilization
BD#1 (B) Ties	2 0%	1) Both rails have 1/8 inch flow 2) Rail kink 60 feet ahead/north of stored rail cars with every 3rd tie fully box anchored 3) Shallow tie cribs	1) Destress rail 2) Surfacing and lining 3) Anchor pattern
BD#2 (A) Ties	4 10%	1) Alignment has minor twist 2) Cross level near 3/8 inch high east rail 3) Rail has engine burns, spalling, 1/8 inch flow 4) Skewed cross ties from improper anchor pattern 5) Profile run-off each approach to concrete direct fixation is abrupt 6) Turnout SH-11 turnback/return curve has 1-1/4 inch reverse superelevation with curve pushing/sliding outward, sinkhole extending 150 feet	1) Surfacing and lining 2) Track maintenance 3) Anchor pattern 4) Subgrade stabilization 5) Cross/super-elevation 6) Destress rail
BD#2 (B) Ties	3 0%	1) Alignment is irregular, and profile is in a depression 2) Track ballast shoulders heaved 18 inches for 50 feet with shallow tie cribs 3) Rail has corrugations and 1/8 inch flow 4) Cross level near 1/2 inch high west rail	1) Surfacing and lining 2) Subgrade stabilization 3) Cross/super-elevation
BD#2 (C) Ties	2 10%	1) Light vegetation 2) Alignment has swing into turnout SH-08 switch points and swing ahead of turnout SH-09 switch points 3) Rail has rail end batter, spalling, engine burns 4) Cross level near 3/8 inch high east rail	1) Vegetation control 2) Surfacing and lining 3) Rail end treatment 4) Cross/super-elevation
BD#3 (A) Ties	2 0%	1) Rail joints are tight 2) Alignment curve is pushing outward 3-5 inches with 1/8 inch gauge face wear on outside rail and	1) Destress rail 2) Surfacing and lining

Track Section I.D.	Grade	Finding Notes	Recommended Treatment
		profile in curve is in a depression between direct fixation and Grade Crossing #24	
BD#3 (B) Ties	1 0%	1) None	None
BD#4 (A) Ties	4 50%	1) Alignment has a swing with low spots in profile which is exasperated within limits of the steel canopy 2) Rail is 2 inches out of cross-level along east rail possibly from poor subgrade condition 3) Steel canopy downspouts empty into track 4) Light vegetation	1) Tie renewal 2) Cross/super-elevation 3) Surfacing and lining 4) Establish drainage 5) Subgrade stabilization 6) Vegetation control
BD#4 (B) Ties	4 50%	1) Rail is 1-1/8 inch out of cross-level along east rail 2) Tie plates are 4-hole 9 inch single shoulder for 67 lb. rail dated 1899/1904 with 6-hole joint bars and 4-bolt assembly 3) Light vegetation 4) Mismatch rail ends at compromise joint bars	1) Tie renewal 2) Cross/super-elevation 3) Vegetation control 4) Rail end treatment 5) Relay rail 6) Tie plate renewal
BD#5 (A) Ties	4 40%	1) Rail in curve has flow on inside rail possibly from incorrect 7/8 inch superelevation 2) Light vegetation 3) Outside rail gauge side lubricator non-functioning 4) Rail head (less than 2-inches wide) in curve through Grade Crossing #29 to Turnout SH-13 5) Shallow tie cribs and 90RA rail that is pitted through limits of removed grade crossing and compromised to 112RE rail	1) Tie renewal 2) Cross/super-elevation 3) Rail/wheel friction control 4) Vegetation control 5) Surfacing and lining 6) Relay Rail
BD#5 (B) Ties	4 70%	1) Alignment is irregular with a rolling profile 2) Cross level is in excess of 1-1/4 inch 3) Heavy vegetation 4) Track ballast heavily fouled and partially buried 5) There is no evidence of positive drainage	1) Tie renewal 2) Cross/super-elevation 3) Vegetation control 4) Surfacing and lining 5) Establish drainage 6) Track ballast renewal
BD#5 (C) Ties	3 20%	1) Alignment irregular at rail joints 2) Single shoulder 9 inch tie plates 3) Wheel stops installed	1) Tie plate renewal 2) Surfacing and lining 3) Standard EOT device
BD#5 (D) Ties	1 0%	1) None	None
ML#1	2	1) Loose joint bar bolts	1) Track maintenance

Track Section I.D.	Grade	Finding Notes	Recommended Treatment
(A) Ties	10%	2) Outside curved rail has visible gauge side wear	2) Cross/super-elevation
WH#1 (A) Ties	3 0%	1) Alignment curve has 5/8 inch reverse superelevation with signs of rail movement at tie ends 2) Rail on outside of curve has 1/8 inch gauge face wear	1) Cross/super-elevation 2) Destress rail
WH#1 (B) Ties	1 0%	1) None	None
WH#1 (C) Ties	1 0%	1) None	None
WH#2 (A) Ties	1 0%	1) None	None
WH#3 (A) Ties	1 0%	1) None	None
WH#4 (A) Ties	3 0%	1) Profile has dip hear Turnout WH-04 2) Alignment curve has 5/8 inch reverse superelevation with signs of rail movement at tie ends near Turnout WH-04 3) Alignment curve is pushing outward (rail kink) 6 inches with dip near Grade Crossing #34	1) Cross/super-elevation 2) Surfacing and lining 3) Destress rail
WH#4 (B) Ties	1 0%	1) Rail has 1/8 inch rail flow	None

5. Granite City Harbor Track Table – Summary of Condition Grades.

Track Section I.D.	Grade	Finding Notes	Recommended Treatment
AL (A) Ties	4 70%	1) Alignment is in a twist and profile is low with a considerable low spot on east side of Grade Crossing #2 2) Rail has ¼ inch flow and heavily worn from rolling contact fatigue, ¼ inch gauge face wear near Grade Crossing #2 3) Track ballast is fouled with signs of pumping and shallow tie cribs east of Grade Crossing #1	1) Tie renewal 2) Surfacing and lining 3) Track maintenance 4) Tie plate renewal 5) Subgrade stabilization 6) Track ballast renewal 7) Cross/super-elevation 8) Rail end treatment

Track Section I.D.	Grade	Finding Notes	Recommended Treatment
		and #2 4) Tie plates are heavily worn with wallowed spike holes 5) Gauge rods installed 6) Cross level measures 7/8 inch near Turnout NH-03 possibly from poor subgrade 7) Light rail end batter possibly from loose joint bar bolts under load 8) Profile has 2-1/4 inch superelevation on the outside rail near Grade Crossing #2 9) Vegetation recently sprayed with new growth	9) Vegetation control
AL (B) Ties	4 60%	1) Rail end batter possibly from loose joint bar bolts under load 2) Alignment is twisted with a rolling profile 3) Vegetation recently sprayed with new growth	1) Tie renewal 2) Rail end treatment 3) Track maintenance 4) Vegetation control 5) Surfacing and lining
AL (C) Ties	3 20%	1) Vegetation recently sprayed 2) Single shoulder 7 inch tie plates 3) Track ballast is lightly fouled 4) Alignment irregular ahead of Turnout NH-05 with contributions from turnout immediately behind Turnout NH-05 and within close proximity to Grade Crossing #3 5) Profile has low spot between Turnout NH-05 and Grade Crossing #3	1) Tie plate renewal 2) Surfacing and lining
AL (D) Ties	3 20%	1) Single shoulder 10 inch tie plates 2) Rail has flow and rolling contact fatigue with 1/8 inch gauge face wear on outside rail 3) Ponding water north of overhead pipe rack between track and toe of levee	1) Tie plate renewal 2) Establish drainage
AL (E) Ties	3 20%	1) Single shoulder 10 inch tie plates in poor condition 2) No anchors present 3) Rail 90 RA dated 1914 4) Rail joints are low or bent creating a poor rolling profile 5) Little to no tangent between reverse horizontal curves behind Turnout NH-06	1) Tie plate renewal 2) OTM per standards 3) Rail relay 4) Geometry reconfiguration
AL (F) Ties	3 30%	1) Rail is shelling with 1/8 inch flow 2) Turnback curve of Turnout NH-08 has ½ inch reverse elevation	1) Cross/super-elevation 2) Surfacing and lining
AL	3	1) Single shoulder 10 inch tie plates in poor	1) Tie plate renewal

Track Section I.D.	Grade	Finding Notes	Recommended Treatment
(G) Ties	20%	condition	
AL (H) Ties	3 0%	1) Joints have 1 inch gap 2) Single shoulder 11 inch tie plates	1) Tie plate renewal 2) Track maintenance
PP#1 (A) Ties	3 20%	1) Alignment is irregular 2) Gauge rods installed every 6th tie	1) Surfacing and lining
PP#1 (B) Ties	3 10%	1) Lacking south track ballast shoulders 2) Restore earthen mound to standards 3) Moderate vegetation 4) Rail has shelling and 1/8 inch flow 5) Loose joint bars assemblies 6) Alignment has swing adjacent to building 7) Cross level near 1-1/4 inch near east end of building	1) Cross/super-elevation 2) Surfacing and lining 3) Track maintenance 4) Standard EOT device 5) Vegetation control
A1 (A) Ties	3 70%	1) Alignment has a twist with low spots at the rail joints 2) Cross level near ¾ inch in the west rail 3) No rail anchors present 4) Track ballast is fouled 5) Cross ties skewed 6) Loose joint bar assemblies 7) Rail has flow on inside rail and 1/8 inch gauge face wear on outside rail in turnback curve of Turnout NH-06 8) 115 lb. rail measures ½ inch height wear (AREMA Class 4)	1) Tie renewal 2) OTM per standard 3) Cross/super-elevation 4) Surfacing and lining 5) Track maintenance 6) Rail relay 7) Track ballast renewal
NH#1 (A) Ties	3 30%	1) Single shoulder 10 inch tie plates in poor condition 2) Near fouled ballast condition due to lack of proper outfall location of surface drainage from levee upslope	1) Tie plate renewal 2) Establish drainage 3) Track ballast renewal
NH #1 (B) Ties	5 50%	1) Alignment has a swing then twist and profile has a dip. A 62-foot chord measured a vertical top of rail difference greater than 3inches and a horizontal difference of 2-3/8 inches. The vertical profile exceeds the allowable criteria for an FRA Class 1 or excepted track and is considered unsafe for train operations. 2) Cross level measures 1-1/8 inch high on the east rail	1) Tie renewal 2) Surfacing and lining 3) Track maintenance 4) Subgrade stabilization 5) Track ballast renewal 6) Cross/super-elevation 7) OTM per standards 8) Establish drainage

Track Section I.D.	Grade	Finding Notes	Recommended Treatment
		3) Track ballast has pumping 4) No anchors present 5) Tie centers exceeded 25 inches 6) Near fouled ballast condition due to lack of proper outfall location of surface drainage from levee upslope	
XVR#4 (A) Ties	3 0%	1) Cross level measures 1-1/8 inch high on the east rail 2) Alignment curve extends onto Turnout NH-08 up to heel of frog with reverse superelevation contributing to heavy rail wear 2) Single shoulder 10 inch tie plates in poor condition	1) Cross/super-elevation 2) Tie plate renewal 3) Geometry reconfiguration 4) Surfacing and lining

X. Condition Grades – Rail Crossings

1. Assessment of the rail crossings was limited to the length of the casting as measured along the arms from rail joint to rail joint. Conditions outside these limits have been evaluated and graded separately.

2. Rail crossing identification is mapped on Attachment 'B' in a general track schematic and Attachment 'C' with color coded condition grades assigned.

3. Switch tie renewals shown as a percentage (%) of total accumulated visible existing switch ties under the rail crossing divided by the number of poor/very poor switch ties as observed from the surface. Switch tie quantity does not include any long ties on the low tonnage movement or approaches to the arms of the rail crossing casting.

4. Madison Harbor Rail Crossing Table – Summary of Condition Grades.

Rail Crossing I.D.	Grade	Finding Notes	Recommended Treatment
RX#1 Rail Frog Ties	3 1 2 64%	1) Profile in a dip along north-south movement 2) Alignment curves into rail crossing are shoved out 3) Light vegetation 4) Frog points have flow 5) Low rail inner guardrail has moderate face wear	1) Surfacing and lining 2) Vegetation control 3) Welding/grinding 4) Switch tie renewal
RX#2 Rail	2 1	1) Light vegetation	1) Vegetation control

Rail Crossing I.D.	Grade	Finding Notes	Recommended Treatment
Frog Ties	1 23%		
RX#3 Rail Frog Ties	3 1 2 54%	1) Profile in a dip along north-south movement 2) Light vegetation	1) Surfacing and lining 2) Vegetation control 3) Switch tie renewal
RX#4 Rail Frog Ties	2 1 2 37%	1) Low west side tonnage rail has gap between steel base and tie 2) Frog points have flow 3) Alignment is twisted in the north-south movement	1) Surface and lining 2) Welding/grinding 3) Switch tie renewal

XI. Condition Grades – Direct Fixation

1. Rail direct fixation assessments limited to the length along the entire structure that supports the rail that it is directly fixated. Conditions outside these parameters to be evaluated and graded separately.

2. Direct fixation identification is mapped on Attachment 'B' in a general track schematic and Attachment 'C' with color coded condition grades assigned.

3. Madison Harbor Direct Fixation Table – Summary of Condition Grades.

Direct Fixation I.D.	Grade	Finding Notes	Recommended Treatment
DF#01 Rail	2 2	1) Dip on both track approaches 2) Loose No. 64 clips	1) Surfacing and lining 2) Track maintenance
DF#02 Rail	2 1	1) Dip in both track approaches with slight alignment twist	1) Surfacing and lining
DF#03 Rail	2 2	1) Some loose concrete anchor bolts 2) Dip in both track approaches	1) Reset direct fixation 2) Surfacing and lining
DF#04 Rail	2 2	1) Some loose concrete anchor bolts 2) Dip in both track approaches	1) Reset direct fixation 2) Surfacing and lining
DF#05 Rail	3 3	1) Some loose concrete anchor bolts	1) Reset direct fixation

XII. Treatment Schedule

1. Recommend a detailed treatment schedule be developed in close coordination with the Port who shall confirm and identify current and future train movements and tonnage volumes. The treatment schedule shall take into consideration the current demand for rail operations, historical maintenance issues and forecasted rail volumes.

2. FRA TSS 49 C.F.R. Part 213 Subpart F – Inspection states

   a. Excepted track and Class 1 track shall be inspected monthly with at least 20 calendar days interval between inspections.

   b. Each switch, turnout and rail crossing, or other transition device shall be inspected on foot at least monthly (213.235).

3. The rail elements with a Grade of E should be inspected prior to the passage of any and every train and repaired as soon as possible with the highest of priority.

4. The rail elements with a Grade of D should be inspected every seven (7) calendar days with repairs being performed within six (6) months.

5. The rail elements with a Grade of C should be inspected basis with repairs performed within one (1) to two (2) calendar years. These actions will help prevent the development of additional deficiencies affecting the integrity of the existing rail structure. on a monthly

6. The rail elements with a Grade of B should be inspected on a monthly basis with repairs made within two (2) to three (3) calendar years. These actions would ensure the integrity of the existing rail structure and reduce future maintenance costs.

7. The rail elements with a Grade of A shall be inspected on a monthly basis with repairs made within three (3) to five (5) calendar years. These actions would ensure the integrity of the existing rail structure and reduce future maintenance costs.

XIII. Summary of Conditions

1. Select photos of the rail infrastructure assessed conditions that were recorded in the Finding Notes are illustrated in Attachment E for general reference.

2. **Rail:** The American Railway Engineering and Maintenance-A-Way Association (AREMA) recommends when new rail is required it be limited to 115 lb., 136 lb. and 141 pound rail sections. The majority of rail inspected appeared to be in fair and serviceable condition with rail weights ranging from 67 to 140 pound jointed and continuously welded. Locations were documented where the rail appeared to be reaching the end of its service life and visual indications of rail flaws that could lead to internal defects. As these rail flaws develop into rail defects the need for future replacement increases. Final determination of type and cause of rail defects should be

referred to a railroad industry expert or a laboratory with metallurgy and a rail defect expert. It is recommended that before any rail is replaced, that actions be taken to reduce the occurrence of these defects to prevent them from reoccurring. Items that contribute to the development of rail defects are illustrated in the photos referenced in the Attachment 'E' and include engine burns, pitting, battered ends, shelling, checking, vertical split heads, excessively top and gauge side wear, corrugations and transverse and longitudinal separation on the surface of the rail head. There was no visible evidence of compound fissures, flawed heads, split webs, detail fractures, horizontal split heads, pipe rail, shelling bends, or weeping cracks noted during this assessment.

3. **Cross Ties:** Wood cross ties generally measured 7"x 9"x 8'6" with a few being 6"x8"x8'6". The majority of the cross ties that were exposed were visibly inspected and deemed in good condition providing effective support and appearing to hold track gauge, providing support to the track surface and alignment. Recommendations on tie renewal has been estimated as a percentage based on a sample size of exposed ties determined to be in poor condition verses the total number of cross ties inspected. The average life expectancy of a hardwood tie under traffic ranges from eighteen (18) to twenty five (25) years depending on climate, traffic and track alignment and conditions. Recommend tie renewal continue on an annual basis to ensure the applied wheel load is spread through well maintained track minimizing the uplift wave effect beyond the point load distribution.

4. **Joint Bars:** Joint bars were predominately the "toeless" type, ranging from twenty-four (24) inches to thirty-six (36) inches in length with 4-hole to 6-hole punching providing a rail joint spacing ranging from zero (0) to five-eights (5/8) of an inch. Toed joint bars were located within the 90 lb. and lighter rail sections with rail gaps exceeding five-eights (5/8) of an inch. Almost all the bars were fully bolted with standard track bolts, locking washers and nuts uniformly staggered. Locations were identified that had missing or loose bolt assemblies in both the track and turnouts with particular attention to the bolts in the frog casting and heel blocks. Improper rail end gaps may result in excessive rail end chipping, batter and overflow that can develop into a split rail head. As this condition is found, recommend a replacement rail plug be installed at these locations to properly correct the rail joint gap width based on the ambient temperature as the rail is changed out.

5. **Tie Plates:** Tie plates located under the rail were primarily double shoulder with either a 6-hole or 8-hole rail spike hole punching measuring over eleven (11) inches in length between eleven (11) and fifteen (15) inches in length. A low percentage of the tie plates observed were of poor quality single and double shoulder with a length of less than eleven (11) inches and less than 6-hole punch pattern, still considered serviceable. Some of the single shoulder tie plates were identified as being in very poor condition by being severely bent, broken or containing excessive corrosion which was exasperated by poor tie and surfacing conditions resulting in substantial plate cutting or rail base cutting into the cross and switch tie. The single shoulder tie plates were primarily located below the 90 lb. and smaller rail sections. These tie

plates should be replaced with larger double shoulder tie plates that would improve track stability, especially through the horizontal curves. The larger tie plates distribute the wheel loads over a larger area of the cross tie reducing the amount of plate cutting into the cross tie and providing greater gauge holding control. Larger tie plates also more evenly distribute the wheel loads from the rail onto the cross ties into the ballast and subgrade, reducing subgrade pressures, one of the factors that causes track pumping and instability of the track structure. It is a current industry best practice to install curve block plates where a six (6) axle locomotive may traverse a horizontal curve that exceeds the serving railroad preferred standard of seven (7) to ten (10) degrees.

6. **Track Spikes:** Track spikes generally consist of two (2) per tie plate on tangent and three (3) to five (5) per tie plate in curved track and through the length of the turnouts. The track spikes all appear to be tight and properly driven. A consistent spiking pattern is recommended to provide uniform support to the rail while maintaining proper gauge by providing lateral resistance holding the tie plates in proper position. Horizontal curves that exceed the serving railroads standards and have six (6) axle locomotives operating over the track should consider a spiking pattern of five (5) to six (6) spikes per tie plate.

7. **Rail Anchors:** Rail anchors were observed in the majority of the heavier rail sections of the track at every other tie or eight (8) ties per 39 foot of rail. Turnouts were generally fully box anchored every switch tie including the track ahead and behind the turnout except where the 90 lb. and smaller rail sections were located. Special anchor pattern was observed on the downhill grade of the A-Lead track from top of the levee. Locations were noted where it is recommended that the rail anchor pattern be revised to address the visible signs of rail creeping by pushing the cross ties causing voids in the track ballast tie cribs and track misalignments. The primary function of rail anchors is to hold the rail in a fixed position with respect to the cross tie by restricting the longitudinal movement of the rail under traffic and thermal expansion/contraction. Inadequate rail restraint by the lack of rail anchors allows rail to creep which can lead to uneven rail wear, irregular gauge and excessive gaps at rail ends and bolts braking at the rail joints. Rail creep can also close some rail joint gaps while opening others and if severe enough, there is potential for the track to become misaligned. Rail creep can also cause the cross ties to skew resulting in narrow rail gauge and increased rail wear.

8. **Track Ballast:** The track ballast utilized appears to be a mix of limestone and trap rock with a mainline gradation except for sections of track where a walkway ballast gradation was placed. The track ballast was generally clean with some areas identified as being fouled either from fines of degraded track ballast or from inadequate drainage of the track section. Fouled track ballast lacks the qualities required to provide the proper track support and drainage. For the track structure to provide proper support and hold surface and alignment the ballast must be kept clean and free of fines. When fines are permitted to accumulate then mix with water forming mud which can act as a lubricant within the ballast section causing the ballast

to lose its ability to laterally restrain the track and distribute loads uniformly. This condition also has an adverse effect on the ability of the track to maintain proper cross level and surface, creating a cement-like mass that traps water around the cross ties leading to softened subgrade accelerating their deterioration.

9. **Track Gauge:** Track gauge was measured and generally within industry tolerance with the widest track gauge measured in the horizontal curves. This is an acceptable practice allowing the rail car wheels the flexibility in chording through the curves. Narrow track gauge was recorded, with gaps along the outside shoulder of the tie plates permitting proper track gauge under traffic (rails had room for lateral movement). This narrow gauge with plate movement condition will in time require the replacement of cross ties due to the spike and plate movement.

10. **Gauge Rods:** Gauge rods were noted at several locations in the track and turnouts. The use of gauge rods is not uncommon where small rail and single shoulder tie plates are located. Gauge rods may be eliminated when a good cross tie condition is maintained, properly sized double shoulder tie plates are present and adequate spiking is maintained. Gauge rods should primarily be used to temporarily maintain gauge in damaged or defective track. Gauge rods over time may become loose or bent resulting in them not performing as intended and causing undesirable stresses on the rail and increasing rail wear. If gauge rods are to be utilized, recommend utilizing double end gauge rods to protect against both narrow and wide gauge. They can be properly adjusted even if bent or otherwise damaged.

11. **Turnouts:** The turnouts inspected appeared to be regularly lubricated along the switch rails and greased at the switch stands. Turnouts were generally in good condition, measured to be number sevens (No. 7's), number eights (No. 8's) and number nines (No. 9's) with rail bolted, solid manganese self-guarded (SMSG) or rail-bound manganese (RBM) frog castings. Several minor maintenance items were observed that included the need to replace and tighten bolt assemblies, tightening the locking nut on the connecting rods, assuring all bolts that can receive a cotter key have a cotter key properly installed and building up and shaping of the switch and frog points by welding and grinding. Some switch rails appeared heavily worn particularly the curved closure rails where the gauge face of the rail heads have been worn down to an excessive slanted surface. Several switch stands need to be secured to the headblock ties and properly adjusted with target replaced with proper colors.

12. **Alignment:** Track alignment and surface was generally in good condition except at the noted locations where the track was misaligned contributing to the rail wear. There are portions of track that requires surfacing to correct poor cross level, and through several horizontal curves to establish proper super-elevation removing the reverse cross level that currently exists. There are numerous sink holes present within the track structure that appear to be contributing to a twisted rail profile and creating geometry misalignments. Track misalignments can be exasperated by the longer and heavier rail cars being utilized, heavier 6-axle locomotives and switching operations that involve sudden braking and acceleration when pushing and pulling loaded and empty rail cars. These effects are compounded when the track geometry includes

sharp and reverse horizontal curves within close proximity to one another. Track misalignments contribute to decreased life expectancy of a rail section and cross ties. Proper track alignment and tamping to re-consolidate the track ballast under the cross ties providing proper support to the rail joints improves train handling and decreases track maintenance.

13. **Grade Crossings:** The existing grade crossing surfaces varied from full depth asphalt, rubber rail seal with asphalt, solid timber, 4 to 8 board with asphalt and precast concrete panels. The roadway approaches to the grade crossing surfaces were relatively level which is a preferred condition. ACP prefers the grade crossing surfaces utilize a rubber rail seal with asphalt surface and asphalt roadway approaches. Several crossings had rail joints within the crossing surface, recommend when these crossings are upgraded to remove all joints through and within twenty (20) feet of a grade crossing surface. The four (4) quadrants of each grade crossing should be shaped to properly drain both the track ballast section and roadway surface water away from the track and roadway. Placement of underdrains under grade crossings and maintaining clean ballast through the crossing minimizes the trapping of water within the grade crossing.

14. **Rail Crossings:** The existing rail crossings were generally in good condition with even wear along the rail and frog points. The heavy haul tonnage routes were observed as contributing to a depression in one direction of the rail crossing profile and deterioration of the switch ties. Switch tie renewal and tamping to re-consolidate the track ballast under the switch ties to re-establish the original rail profile will provide long term benefits providing proper support to the rail crossing switch ties that will improve train handling and decrease maintenance while maximizing the service life of the custom rail crossings.

15. **Drainage:** Drainage around the track structure is always a concern and a leading cause of accelerated deterioration and wear of the track structure leading to decreased cross tie life, creating fouled ballast resulting in increased rail wear contributing to future maintenance and other service failures. The rail infrastructure generally had clean track ballast that was well drained. Ponding water was noted at several areas, but they were typically located away from the track ballast section. Any drainage work that can be performed to direct water away from the track structure by either an open ditch or underdrain system will have immediate and long-term benefits to the maintenance of the track structure.

XIV. Conclusion

The rail condition assessment results confirm that the Port has implemented industries best practices meeting and exceeding Class I railroad industrial standards in new construction and rehabilitation. It is apparent the Port has been regularly inspecting the rail infrastructure and performing maintenance in a timely manner to maintain the Class I railroad industrial standards while exceeding the Federal Railroad Administration Class 1 Track Safety Standards pursuant to 49 C.F. R. Part 213.

Recommend that in addition to the current maintenance program that the following programs be incorporated. These additional programs will result in a decrease in likelihood of regular problematic maintenance items that were listed in the Finding Notes and provide an increase in service life of the rail infrastructure.

1. Vegetation Control

    a. Vegetation control is necessary for proper track drainage, visibility for inspections and fire prevention, while reducing slips, trips and falls of those working along the track.

    b. Vegetation should be managed with an application of weed spray or other environmentally approved method on an annual basis or as site conditions require extending at a minimum of twelve (12) feet from centerline of track.

    c. A pre-emergent herbicide should be applied to eradicate weeds before they grow between the third week of March and end of April.

    d. A post-emergent herbicide can be applied beginning June 1 to eradicate plants that have sprouted and were not killed by a pre-emergent application. This application can be performed by spot spraying on an as-needed basis.

    e. Aggregate surfaces outside of the rail structure shall also have vegetation control which can include rip rap areas, around drainage structures such as inlets and pipe ends and at-grade vehicular crossings.

2. Track Surfacing

    a. Identify rail elements and sections of track of high, medium and low volume with consideration of track sections continuing extreme curvature, have experienced reverse cross level and super-elevation criteria or through areas where poor subgrade conditions exist. These sections of track should be assigned priority codes determining the frequency of surfacing.

    b. Develop a schedule to mobilize a tamper and regulator to surface and line track sections and rail elements on a rotating annual basis based on the assigned priority code. The surfacing equipment should be supported by a workforce to place track ballast and perform any quality assurance and quality control following completion of the surfacing work.

    c. Based on the available funding, work windows and other logistical constraints all rail elements and track sections should be incorporated into a schedule within a determined period of time (e.g., five (5) years).

    d. Regular surfacing and tamping of track sections and rail elements includes rail joints to ensure proper support decreasing the likelihood of rail end batter, bent rail ends, deterioration of joint components including loose and broken bolts, inability to hold gauge, uneven rail wear, deformation of the switch and frog points and wing-rails, low or pumping joints and holding proper cross-level and

super-elevation for improved train handling.

3. Rail Friction Modification (Lubrication)

   a. In coordination with a third party service and rail friction modifier (lubricator) supplier, complete an analysis of train handling performance to identify sections of track that would benefit from the installation of high rail gauge face and top-of-rail friction modification equipment.

   b. Areas of interest include sections of track of extreme horizontal curvature or short tangent lengths between reverse curves.

   c. High rail gauge face lubrication increased the required L/V ratio for a derailment and decreases the risk of derailment.

   d. Low rail top-of-rail lubrication reduces lateral wheel forces and derailment risk.

   e. Friction modification decreases rail wear and damage to rail and fasteners.

4. Subgrade Stabilization

   a. Perform a ground penetrating radar along sections of track that have current and have historically had sink holes.

   b. Identify extents of potential subgrade instability and develop alternatives for stabilization that may include the track being kept in-service or being removed and performed during a track outage.

   c. Develop a subgrade stabilization program with a firm specializing in repairing track embankment with poor soil conditions.

   d. Create a schedule to address these sections over time obtaining mitigation at those sites that require the most ‘on-going’ maintenance efforts.

5. Rail Relay

   a. Develop a rail relay program to replace all rail not currently meeting current AREMA recommendations. This includes replacing all 90lb and lighter rail size with 115lb or heavier rail section with AREMA Plan double shoulder tie plates. Tie plates shall have a minimum length of twice the width of the rail base in tangent track and at least thirteen (13) inch or fourteen (14) inch in the curves. It is recommended as best practice to have thirteen (13) inch tie plates be used in tangent track and a minimum of fourteen (14) inch tie plates for curves and turnouts. All plates shall meet AREMA Plan 7 or 8 for five and one half (5-1/2) inch base of rail or AREMA Plan 11 or 12 for six (6) inch base of rail.

   b. Rail relay shall be prioritized based on current and future rail traffic volume, track geometry, defects and historical maintenance records. Field notes indicate the Granite City Harbor being of high priority based on size and condition of the

existing rail, current and future switching of rail cars and track geometry.

c. Rail shall be relayed in suitable lengths with spot cross tie renewal to be effective in providing improved conditions.

d. Rail relay does not include rail through the limits of a turnout. Based on field observations any turnouts with 90lb or smaller rail should be replaced as a single unit when warranted.

6. Tie Renewal

a. Appears a tie renewal program has been implemented, recommend it be continued as funds allow based on an annual inspection and traffic volume.

b. Cross and switch tie renewal is an on-going effort in maintaining an applied load distribution through the track ballast section into the subgrade foundation. A wheel load can be distributed along up to nine (9) ties at standard heavy haul tie spacing. Ties adjacent to a failed or defective tie are forced to support an increased share of the vertical point and lateral wheel load, which increases the magnitude of the load applied to the non-failed/defective ties. The result is a decreased service life of a ‘good’ tie adjacent to a failed or defective tie.

7. Track and Turnout Inspection

a. In accordance with the FRA Track Safety Standards under 49 CFR 213.233 visual track inspections shall be performed on a prescribed frequency and manner. Visual track inspections include each switch, turnout and rail crossing.

b. Under subpart F, Excepted track and Class 1 track designated as “Other than main track and sidings” require a monthly visual track inspection with at least twenty (20) calendar days interval between inspections.

c. Under §213.239, extreme weather or seismic events, and any report that create a 'knowledge standard' from any source, may warrant special supplementary inspections.

Notes
(1) [#] - Number of locations.
(2) NS = Norfolk Southern
(3) ACP = America's Central Port
(4) "Length" – The length of the crossing surface is measured in feet parallel to the tracks, along the improved surface of the crossing, which may extend beyond the edges of highway pavement and any sidewalks that may be present. In general, the crossing surface material will extend approximately 3 feet on each side beyond the roadway/pathway.
(5) "Width" – The width of the crossing surface is measured in feet perpendicular to the railroad tracks and is the distance between the outermost edges of the crossing surface (including multiple tracks if present). In the event that the crossing surface is indistinguishable from the roadway approach, the width is the distance between the outermost rails of the crossing plus 4 feet.
(6) "Commercial Power" - Enter a check to indicate whether there is commercial electric power available within 500 feet of the crossing. This field is optional.
(7) Location has NS ENS 3280684 sign installed at 2 separate posts.
