

**Wetland Mitigation Monitoring Report for the FAP 42 (IL 13/127) site  
near Pyatts, Perry County, Illinois  
(Fifth monitoring year--2006)**

by Paul Tessene, Jesse Kurylo, Ian Draheim, and Jason Zylka  
Illinois Natural History Survey, Champaign

## **Summary**

Based on observations made during the 2006 growing season (fifth year of monitoring), the following is a summary relating the likelihood that the compensation site will meet each goal within the five-year monitoring period. The goals, objectives, and performance standards follow those outlined in the IDOT monitoring request (15 April 2002).

Overall Project goal: To create and restore 3.8 ha (9.5 acres) of wetland (including forested wetland, pond, sedge meadow, and wet prairie areas), and preserve and enhance 2.2 ha (5.5 acres) of existing floodplain forest. (Note: ISGS measurements put the size of the entire site at 6.7 ha (16.4 acres) instead of 6 ha (15 acres) as noted in the IDOT monitoring request.)

Hydrophytic vegetation, hydric soils, and wetland hydrology are currently present on much of the area designated "restored forested wetland." Only part of the area designated "shallow emergent pond" meets wetland criteria, because the proposed pond berm was not constructed. The planned "wet mesic prairie" and part of the "sedge meadow" lack dominant hydrophytic vegetation, hydric soils, and wetland hydrology, and are unlikely to develop these under current conditions.

Vegetation that colonized the "restored forested wetland" site is dominated by native, aggressive species. Most of the planted pecan saplings survived and appear to be doing well, and planted pin oaks that did not survive are being replaced by natural regeneration. The performance standard of 80% survival of planted trees is not met; swamp white oaks (especially) will need to be planted to maintain compliance. Fewer shrubs were observed than expected and follow no pattern, but those observed appear healthy and capable of persisting and spreading.

The prairie seeding appears well established, but fescue is also predominant, and should be controlled to allow native species to dominate. This area will never become wetland, for it lacks necessary hydrology, soils, and vegetation. The berm for the pond remains unconstructed, so the development of the "pond" and "sedge meadow" communities as wetlands will be limited.

Wetland hydrology is present for more than 5% of the growing season on about 2.0 ha (4.8 acres) of the mitigation site in 2006, and on about 0.4 ha (1.0 acre) for more than 12.5% of the growing season. For the five year monitoring period, about 2.1 ha (5.1 acres) meets the 5% criterion and 0.7 ha (1.7 acres) of that area meets the 12.5% criterion. About half of this area (and almost all the area that meets the 12.5% criterion) is located within the floodplain forest that was present before this mitigation site was established. Thus, conditions on the site did not allow for the total amount of created wetland that was intended when the site was established.

## Introduction

This report describes the fifth year of monitoring of wetlands created, restored, and preserved to mitigate for wetlands affected by the resurfacing and partial realignment of FAP 42 (IL 13/127) between Murphysboro and Pinckneyville in 2001.

Wetland delineations were previously conducted on a pre-existing floodplain forest within the mitigation site (Tessene and Brooks 1991; Wilm *et al.* 2002).

The site plan for this wetland mitigation site did not state whether earthwork would be done to achieve site goals, other than an inclusion of a berm to create a shallow pond, as shown on the site map. Proposed plant communities for the site included: 1) wet mesic prairie, 2) a shallow pond, 3) a sedge meadow, 4) a floodplain forest restoration (“restored forested wetland”) and 5) preservation of existing floodplain forest. The restoration/creation areas were to be planted with seeds, with rootstocks at the pond, and plantings of saplings and shrubs in the “restored forested wetland” area.

Preparation of the site was completed at least a year before monitoring began, for perennial vegetation was well established on the intended creation/restoration area. Of special note was the seeding of prairie grasses and forbs on part of the site; their abundance would suggest that more than a year had gone by since planting.

## Goals, Objectives, and Performance Criteria

In the request to monitor the site (Scott Marlow, IDOT, 15 April 2002), the only explicitly stated goal was that 80% of planted trees should survive to the end of the five-year monitoring period. Because the materials describing the site included a site plan map and lists of species that were proposed for planting on the site (Table 1); thus, an implied additional goal would be that the vegetation of the site and site conditions would approach the plan. Additional goals are based on those specified in the US Army Corps of Engineers wetland delineation manual (Environmental Laboratory 1987) and Guidelines for Developing Mitigation Proposals (USCOE 1998).

Project Goal 1: Each of the created wetland plant communities should be jurisdictional wetlands as defined by current federal standards.

Objective: The created wetland areas will be formed in a 9.5-acre former crop field.

Performance criteria:

- a. Predominance of hydrophytic vegetation: More than 50% of the dominant plant species must be hydrophytic.
- b. Presence of hydric soils: Hydric soil characteristics should be present, or conditions favorable for hydric soil formation should persist at the site.
- c. Presence of wetland hydrology: The area must be either permanently or periodically inundated at average depths less than 2 m (6.6 ft), or be saturated to the surface, for at least 12.5% of the growing season.

Project Goal 2: The created wetland plant communities should meet standards for floristic composition and vegetation cover.

Objectives: A floodplain forest will be created by planting native woody species. A wet-mesic prairie will be established through seeding. A pond and sedge meadow will be established through seeding and planting rootstocks. The plantings will supplement the natural increase of herbaceous and woody species appropriate for the sites.

Performance criteria:

- a. Planted species survivorship: At the end of the five-year monitoring period, living representatives of the seeded and planted species should be present.
- b. Dominant plant species: None of the three most dominant plant species in the planned wetland plant communities should be non-native species.

Project Goal 3: The planted trees should meet minimum standards for survival.

Objectives: Planting native tree species should help foster the development of floodplain forest on part of the site. Shrub species will be planted as part of the understory.

Performance criteria:

- a. Planted species survivorship: At the end of the five-year monitoring period, 80% of the planted trees should be represented by living stems. The shrub species should show evidence of persisting on the site.

Table 1. Lists of species proposed for each planting area on the site.

Area 1—wet –mesic prairie (seed mixture)	Area 2—shallow pond (rootstocks)
<i>Agrostis alba</i>	<i>Acorus calamus</i>
<i>Andropogon gerardii</i>	<i>Pontedaria cordata</i>
<i>Panicum virgatum</i>	<i>Sagittaria latifolia</i>
<i>Sorghastrum nutans</i>	<i>Saururus cernuus</i>
<i>Aster novae-angliae</i>	
<i>Liatris pycnostachya</i>	
<i>Ratibida pinnata</i>	
<i>Rudbeckia hirta</i>	

Area 3—sedge meadow (seed mixture)	Area 4—restored floodplain forest (seeded grasses and planted shrubs and trees)
<i>Agrostis alba</i>	<i>Agrostis alba</i>
<i>Calamagrostis canadensis</i>	<i>Ilex decidua</i>
<i>Carex grayi</i>	<i>Itea virginica</i>
<i>Carex lacustris</i>	<i>Lindera benzoin</i>
<i>Elymus canadensis</i>	<i>Carya illinoensis</i>
<i>Iris shrevei</i>	<i>Liquidambar styraciflua</i>

<i>Juncus effusus</i>	<i>Quercus bicolor</i>
<i>Lobelia cardinalis</i>	<i>Quercus palustris</i>
<i>Scirpus validus</i>	<i>Quercus shumardii</i>

## Methods

### Project Goal 1

#### a) Predominance of hydrophytic vegetation

The method for determining dominant hydrophytic vegetation at a wetland site is described in the Corps of Engineers Wetlands Delineation Manual (Environmental Laboratory 1987), based on areal coverage estimates for individual plant species. Each of the dominant plant species is assigned its wetland indicator rating (Reed 1988). A plant species that is rated facultative or wetter (FAC, FAC+, FACW, or OBL) is considered to be hydrophytic. If more than 50% of the dominant species present are hydrophytic, this criterion of wetlands is met. Separate wetland determinations were done for each of the plant communities, and for wetland and non-wetland areas within the existing floodplain forest. (See Goal 2b below.)

#### b) Occurrence of hydric soils

To monitor hydric soil development, the soil was sampled. Soil profile morphology, including horizon color, texture, and structure was analyzed at representative points in each plant community on the site. Additionally, the presence, type, size, and abundance of redoximorphic features were recorded. In the absence of hydric soil indicators, hydrologic data can be used to confirm that conditions favorable for hydric soil formation persist at the site (Environmental Laboratory 1987).

#### c) Presence of wetland hydrology

Indicators of wetland hydrology include, but are not limited to, drift lines, wetland drainage patterns, sediment deposits on leaves, watermarks on trees, and visual observation of inundated or saturated soils (Environmental Laboratory 1987). Personnel from the Illinois State Geological Survey (ISGS) installed stage gages and monitoring wells in order to monitor the hydrology of the site. Monitoring well data from the ISGS in 2002 (Pociask and Lake 2002) were incomplete, but were sufficient in later years to estimate acreage that met the wetland hydrology criterion (Pociask and Lake 2003; Pociask and Shofner 2004, 2005; Pociask 2006).

### Project Goal 2

#### a) Planted species survivorship

The mitigation plan for the site states that 20 herbaceous species were planted (Table 1 above). The mitigation site was surveyed for the presence of live individuals of the listed species

#### b) Dominant plant species

A complete vegetation survey of the entire wetland creation/restoration site was conducted. Separate species lists for each vegetation area were composed, and for wetland and non-wetland

areas within the pre-existing forested area. Most of the area proposed as pond and sedge meadow did not appear different than the prairie area, thus the species list for these areas were combined. Dominant species for each vegetation area were those that appeared to have the greatest abundance or cover.

Included with the assessment of a site is the site's Floristic Quality Index, as described by Swink and Wilhelm (1994) and Taft *et al.* (1997). Although the Index is not a substitute for quantitative vegetation analysis in assessing plant communities, it provides a measure of the floristic integrity or level of disturbance of a site. Each plant species native to Illinois is assigned a rating between 0 and 10 (the Coefficient of Conservatism) that is a subjective indicator of how likely a plant may be found on an undisturbed site in a natural plant community. A plant species that has a low Coefficient of Conservatism (c) tends to be common and is likely to tolerate disturbed conditions; a species with a high c is relatively rare and is likely to require specific, undisturbed habitats. Species that are not native to Illinois are not rated.

To calculate the Floristic Quality Index (FQI), first compute the mean c value ( $\bar{c}$ ),  $\bar{c} = (\sum C)/N$ , where  $\sum C$  represents the sum of the numerical ratings (c) for all species native to Illinois recorded for a site, and N represents the number of native species on the site. The c value for each species is shown in the species list for the site. The FQI of each site is determined by multiplying the mean c value by the square root of N ( $\bar{c} \sqrt{N}$ )(equivalent to  $\sum C/\sqrt{N}$ ). An Index score below 10 suggests a site of low natural quality; below 5, a highly disturbed site. An FQI value of at least 20 ( $\bar{c}$  above 3.0) suggests that a site has evidence of native character and may be considered an environmental asset.

### Project Goal 3

#### a) Planted species survivorship

The mitigation plan for the site states that 25 individuals of five different tree species (*Carya illinoensis*, *Liquidambar styraciflua*, *Quercus bicolor*, *Q. palustris*, and *Q. shumardii*) would be planted, and that 80% of the trees should survive for the five years of monitoring. Thus the trees were identified to species and enumerated. *Quercus palustris* and *Q. shumardii* are similar species that are most easily distinguished by their acorns, so their numbers were combined. Planted shrub species (*Ilex decidua*, *Itea virginica*, and *Lindera benzoin*), proposed for planting at the rate of 100 each, were also counted.

## **Results and discussion**

### Project goal 1

#### a) Predominance of hydrophytic vegetation

Dominant plant species for each of the vegetation areas are listed in Table 2 below. Full lists of plant species observed are presented in the wetland determination forms at the end of this report (Appendix 1).

Table 2. Dominant plant species by stratum and wetland indicator status.

Area 1: prairie planting

<u>Dominant Plant Species</u>	<u>Indicator Status</u>	<u>Stratum</u>
1. <i>Festuca pratensis</i>	FACU-	herb
2. <i>Sorghastrum nutans</i>	FACU+	herb

Area 2: marsh in drainageway at “pond” location

<u>Dominant Plant Species</u>	<u>Indicator Status</u>	<u>Stratum</u>
1. <i>Juncus effusus</i>	OBL	herb
2. <i>Leersia oryzoides</i>	OBL	herb

Area 3: wet meadow understory in the open tree planting area “floodplain forest restoration”

<u>Dominant Plant Species</u>	<u>Indicator Status</u>	<u>Stratum</u>
1. <i>Agrostis alba</i>	FACW	herb
2. <i>Festuca pratensis</i>	FACU-	herb
3. <i>Juncus effusus</i>	OBL	herb

Table 2. Dominant plant species by stratum and wetland indicator status.(concluded)

Area 4: low area in existing floodplain forest

<u>Dominant Plant Species</u>	<u>Indicator Status</u>	<u>Stratum</u>
1. <i>Quercus palustris</i>	FACW	tree
2. <i>Ulmus americana</i>	FACW-	tree
3. <i>Aster ontarionus</i>	FAC	herb
4. <i>Elymus virginicus</i>	FACW-	herb

Area 5: another low area in existing floodplain forest, near the highway

<u>Dominant Plant Species</u>	<u>Indicator Status</u>	<u>Stratum</u>
1. <i>Acer saccharinum</i>	FACW	tree
2. <i>Platanus occidentalis</i>	FACW	tree
3. <i>Aster lateriflorus</i>	FACW-	herb
4. <i>Cinna arundinacea</i>	FACW	herb

Area 6: majority of existing floodplain forest

<u>Dominant Plant Species</u>	<u>Indicator Status</u>	<u>Stratum</u>
1. <i>Quercus palustris</i>	FACW	tree
2. <i>Ulmus americana</i>	FACW-	tree
3. <i>Lonicera japonica</i>	FACU	woody vine
4. <i>Eupatorium rugosum</i>	FACU	herb
5. <i>Viola pratincola</i>	FAC	herb

For all the sites other than the prairie planting (Area 1), hydrophytic vegetation predominates. The predominance of fescue in the prairie planting is also a potential problem for the development of vegetation on that site, and it is also spreading vigorously into the adjacent wet meadow (Area 3)

b) Presence of hydric soils

According to the soil survey, the soils on the site include the Hoyleton series, which is somewhat poorly drained, and the Bonnie series, which is poorly drained (Grantham and Idorante 1988). Most of the soils throughout the site were similar to the two previously mentioned soils. The Hoyleton series was found within the prairie planting area and the Bonnie series was found in the wetter and lower areas of the site to include low areas in the floodplain forest and restored floodplain forest, and along the "pond" drainageway. A third series, the somewhat poorly drained Belknap, was found on parts of the existing floodplain forest. Soils in the Bonnie and Belknap series are commonly found in the Beaucoup Creek floodplain (This site is located along a small tributary to Beaucoup Creek.). They consist of very deep soils formed in silty alluvium. The Hoyleton series consists of deep soils on low convex ridges in uplands.

Soil cores were examined from representative locations at each vegetation area at the site. Redoximorphic features are present in the soil profiles for Areas 2-5 (vegetation areas in Table 2 above). The site hydrology and morphological characteristics of these soils suggest that they are saturated long enough for anaerobic conditions to occur in the upper profile for a significant duration. Therefore, these soils are hydric. Hydric soil characteristics have been found on parts of Site 6 this year and in 2004 as well; previously, soils on that part of the existing forested area resembled the somewhat poorly draining Belknap soil. The soil in Area 1 has too bright a matrix color to be hydric.

c) Presence of wetland hydrology

Field evidence of wetland hydrology included drift lines, water-borne sediment deposits, and low landscape position. Wetland hydrology on the site derives from local flooding and groundwater input (pers. comm. G. Pociask), but could be affected by floods on Beaucoup Creek from time to time. Four separate areas on the entire site met the wetland hydrology criteria, based on our observations. These include the "pond" drainageway (Site 2), much of the open area in the floodplain forest restoration (Site 3), and two low areas within the existing floodplain forest (Sites 4 and 5). These areas correspond fairly well with the areas that the ISGS found to have wetland hydrology for more than 5% of the growing season this year (Pociask 2006) (see Appendix 2).

In 2006, ISGS measurements suggested that 2.0 ha (4.8 acres) of the mitigation site met the wetland hydrology criterion for more than 5% of the growing season, while 0.4 ha (1.0 acre) had wetland hydrology for more than 12.5% of the growing season (Pociask 2006). In 2003 and 2005, 2.6 ha (6.4 acres) met the wetland hydrology criterion (Pociask and Lake 2003, Pociask and Shofner 2005). On the other hand, 2.1 ha (5.3 acres) met wetland conditions in 2004 (Pociask and Shofner 2004). The area mapped by the ISGS (Appendix 2) includes all the sites considered wetland in this report.

In 2006, the areas that had wetland hydrology for more than 12.5% of the growing season corresponded roughly to wetland determination sites 4 and 5, along with the part of Site 3 along the woods. In 2005, portions of the project area corresponding roughly to Sites 2-5 could be considered to meet the wetland hydrology criterion for more than 12.5% of the growing season; parts of Site 6 met the criterion for over 5% of the growing season. The area with wetland hydrology for the longer

period constituted 1.4 ha (3.4 acres). In 2004, only the area corresponding to Site 5 met the wetland hydrology criterion for 12.5% of the growing season.

## Project Goal 2

### a) Survival of planted species

Table 1 above listed the species intended for planting on the site. Almost all of them were found growing on the site. (See species lists in Appendix 2.) Species commonly occurring in wetlands may have grown from the planted seed, but they could have been derived from local seedbanks as well. Planted woody species are described more fully under Project Goal 3

Three hundred individuals each of four species (*Acorus calamus*, *Pontedaria cordata*, *Sagittaria latifolia*, and *Saururus cernuus*) were proposed for planting in the “pond” area (memo from Scott Marlow 2002). None were observed during our monitoring of the site (Tessene *et al.* 2003, 2004, 2005, and this report), but the memo stated that the species were to be planted after a stable water level was established at the pond.

### b) Dominant plant species

Most of the dominant plant species on the wetland creation/restoration site are native species. One notable exception is *Festuca pratensis* in the prairie planting (Site 1) and wet meadow/floodplain forest restoration (Site 3). This aggressive turf grass may have spread from the nearby roadside planting when the site was established, or it may have been inadvertently introduced in the seed mix for the site. In any case, it should be controlled, perhaps by a combination of controlled burns and herbicide, because it tends to suppress other species growing with it.

Two non-native shrubs, *Elaeagnus umbellata* and *Rosa multiflora*, were also found in the prairie planting. Their numbers are still low, and they should be easily removed through the use of controlled burns, cutting, and herbicide. In the case of controlled burns, an effort should be made to protect the tree and shrub plantings on the mitigation site from fire effects.

*Typha angustifolia* has been a common species in the marsh along the drainageway at the west edge of the site (Site 2). This non-native species appears to be confined to this area on this mitigation site, but the species can spread aggressively, so control by means of herbicide is advised to prevent further spread.

*Agrostis alba*, although sometimes considered a weedy native, is present on the site as a cover crop planting. This species remains dominant in the wet meadow area (Site 3). It is not as aggressive as *Festuca pratensis*, and is likely to be replaced by other species over time.

The small area of prairie planting north of the existing floodplain forest contains a variety of weedy annual and perennial species, many of them non-native. If this site was seeded at the same time as the rest of the prairie planting, perennial species should eventually develop, and come to dominate.

The prairie planting area contained no hydrophytic vegetation in its dominants. This may be in part due to a large proportion of non-wetland species in the seed mix. Also, this area is at a relatively higher elevation than the rest of the site. Fescue, an aggressive non-native, non-wetland grass, is discouraging the growth of other species.

*Lonicera japonica* is dominant and *L. maackii* is locally common in relatively high areas within the existing floodplain forest (Site 6), and is spreading into adjacent open areas. If control measures are used against the other aggressive non-natives discussed above, these would also be good candidates.

### Project Goal 3

#### a) Survival of planted species

Table 4 presents data for planted tree survival, with numbers of observed live stems. According to the memo regarding the site, 25 individuals of five different species were to be planted. (Individuals of *Quercus palustris* and *Q. shumardii* are considered together, since young individuals are difficult to distinguish.

Table 4. Observed survival of planted trees, 2002-2006, at the Pyatts wetland mitigation site.

Species	Live stems Observed				Survival since planting (%)	
	2002	2003	2004	2005	2006	
<i>Carya illinoensis</i>	26	23	24	24	23	92
<i>Liquidambar styraciflua</i>	25	19	22	16	21	84
<i>Quercus bicolor</i>	11	6	3	3	3	12
<i>Quercus palustris/shumardii</i>	38	33	32	40	35	70
<b>Total</b>	<b>100</b>	<b>81</b>	<b>81</b>	<b>83</b>	<b>82</b>	<b>65.6</b>

The survival of pecans remains high. Pin oak numbers are bolstered by natural recruitment from the existing floodplain forest. Perhaps some more of the apparently dead ones had resprouted as well, as some sweetgums had in 2004. In any case, overall survival of planted trees does not meet the performance standard. Thus, more swamp white oaks may need to be planted.

On the other hand, young pin oaks, elms, ashes, and other species are appearing along the edge of the existing floodplain forest in this part of the restoration/creation site. Young ashes and willows are growing thickly along the edge of the woods in the area proposed as sedge meadow as well.

As part of the goal of restoring floodplain forest on part of the mitigation site, shrubs of three species were planted. Nowhere near the 100 of each species proposed for planting were found, though some may have been overlooked in the thick herbaceous cover in the open part of the area. Some were also located in an adjacent part of the existing floodplain forest, and some of

those may have been confused with naturally occurring individuals, rather than planted ones. (*Ilex* and *Lindera* are native to floodplain forests in the area.)

Table 5. Observed survival of planted shrubs, 2002-2006, at the Pyatts wetland mitigation site.

Species	Live stems observed				
	2002	2003	2004	2005	2006
<i>Ilex decidua</i>	40	31	13	10	10
<i>Itea virginica</i>	20	14	26	14	12
<i>Lindera benzoin</i>	5	28	2	10	5
Total	65	73	41	34	27

## Conclusions

After five years of monitoring, 2.1 ha (5.1 acres) on the 6.7 ha (16.4 acre) site has wetland hydrology for at least 5% of the growing season (Pociask 2006). About half of this area is on the wetland creation/restoration part of the site and half within the existing floodplain forest. This falls short of the 3.8 ha (9.5 acres) of creation and restoration that were proposed in the mitigation plan. Much of this is because the prairie planting area, which comprises much of the area of potential wetland creation, lacks hydric soils and is at a landscape position that will not allow for the development of wetland conditions.

Non-native *Festuca pratensis* remains a dominant in the prairie planting area and now dominates in the wet meadow/floodplain forest restoration as well. *Lonicera japonica* remains a dominant in the drier portions of the existing floodplain forest.

Of the 20 herbaceous species listed as planted on the site, 11 are currently present. Planted tree survival is 66%, and planted shrub survival is 11%. Overall, floristic quality of the created and existing plant communities range from fair to good (FQI values from 16 to 30).

## Recommendations

The pond proposed for the site remains unconstructed. If this continues to be a project goal, constructing the berm is necessary in order to establish wetland conditions for the pond and sedge meadow areas beyond the existing drainage way, where wetland conditions already exist).

In order to achieve the desired 80% survival (over five years) of planted trees called for in the initial mitigation site plan, more *Quercus bicolor* will need to be installed. The planted pecans survived at acceptable rates. Pin oaks are being replaced by natural reproduction from the existing forest. Other native tree species are also moving into the open areas.

The prairie planting area meets none of the three wetland criteria. Without excavation of this area, it will never be wetland. However, the main prairie planting has a good cover of

perennial species, and serves as a buffer for the rest of the site. The dominant, aggressive, non-native grass *Festuca pratensis* should be controlled in the interests of increasing plant species diversity. This could be done by using herbicide during the dormant season, because fescue remains nearly evergreen while most native species are dormant by late fall.

Only parts of the existing floodplain forest meet all three wetland criteria. However, this plant community serves as an important buffer for the small stream running through the site.

Job No.: P99-102-90 Project Name: FAP 42 (IL 13/127) wetland mitigation site  
State: Illinois County: Perry Applicant: IDOT District 9  
Site name: Prairie (native grassland)  
Legal Description: SW/4, SW/4, SW/4, Sec. 7 and NW/4, NW/4, NW/4, Sec. 18, T.6S., R.2W.  
Location: Prairie planting area, mainly in the southwest part of the creation/restoration site

Do normal environmental conditions exist at this site? Yes: X No:  
Has the vegetation, soils, or hydrology been significantly disturbed? Yes: No: X

### VEGETATION

<u>Dominant Plant Species</u>	<u>Indicator Status</u>	<u>Stratum</u>
1. <i>Festuca pratensis</i>	FACU-	herb
2. <i>Sorghastrum nutans</i>	FACU+	herb

Percentage of dominant species that are OBL, FACW, FAC+, or FAC: 0%

**Hydrophytic vegetation:** Yes: No: X

**Rationale:** Fewer than 50% of the dominants are OBL, FACW, FAC+, or FAC.

### SOILS

Series and phase: Hoyleton silt loam (Aquertic Hapludalfs)

On Perry County hydric soils list? Yes: No: X

Is the soil a histosol? Yes: No: X Histic epipedon present? Yes: No: X

Redox Concentrations? Yes: X No: Color: 10YR 3/3

Redox Depletions? Yes: No: X Color: N/A

Matrix color: 10YR 4/4

Other hydric soil indicators: Soil is located at a higher topographic position relative to the rest of the site.

**Hydric soils:** Yes: No: X

**Rationale:** The Natural Resources Conservation Service classifies Hoyleton as having somewhat poorly drained and slowly permeable soils. The brightly colored matrix is evidence that this soil is not saturated for a significant period of the growing season. Therefore the soil is not hydric.

### HYDROLOGY

Inundated: Yes: No: X Depth of standing water: None

Depth to saturated soil: Not able to be determined

Overview of hydrologic flow through system: Precipitation and sheet flow contribute water to this site.

Water leaves the site by evapotranspiration and sheet flow.

Size of watershed: Less than 2.6 km<sup>2</sup> (1.0 mi<sup>2</sup>)

Other field evidence observed: None

**Wetland hydrology:** Yes: No: X

**Rationale:** This site is at the highest relative elevation in the project area. The lack of indicators of wetland hydrology suggest that the site is not inundated or saturated long enough during the growing season to meet the wetland hydrology criterion. This site is not included in the area that the ISGS considers as having wetland hydrology.

**ROUTINE ONSITE WETLAND DETERMINATION**

Site 1 (page 2 of 5)

Field Investigators: Tessene, Kurylo, Draheim, and Zylka Date: 19 July 2006  
 Job No.: P99-102-90 Project Name: FAP 42 (IL 13/127) wetland mitigation site  
 State: Illinois County: Perry Applicant: IDOT District 9  
 Site name: Prairie (native grassland)  
 Legal Description: SW/4, SW/4, SW/4, Sec. 7 and NW/4, NW/4, NW/4, Sec. 18, T.6S., R.2W.  
 Location: Prairie planting area, mainly in the southwest part of the creation/restoration site

**WETLAND DETERMINATION AND RATIONALE**

Is the site a wetland? Yes: No: X

**Rationale:** This site meets none of the three wetland criteria. The site is not included in the NWI.

**SPECIES LIST (unplanted species)**

Scientific name	Common name	Stratum	Wetland Indicator	C*

## ROUTINE ONSITE WETLAND DETERMINATION

Site 2 (page 1 of 4)

Field Investigators: Tessene, Kurylo, Draheim, and Zylka Date: 19 July 2006  
Job No.: P99-102-90 Project Name: FAP 42 (IL 13/127) wetland mitigation site  
State: Illinois County: Perry Applicant: IDOT District 9  
Site name: Marsh  
Legal Description: SW/4, SW/4, SW/4, Sec. 7, T.6S., R.2W.  
Location: Along a drainageway extending from the road to the existing floodplain forest

Do normal environmental conditions exist at this site? Yes: X No:  
Has the vegetation, soils, or hydrology been significantly disturbed? Yes: No: X

### VEGETATION

<u>Dominant Plant Species</u>	<u>Indicator Status</u>	<u>Stratum</u>
1. <i>Juncus effusus</i>	OBL	herb
2. <i>Leersia oryzoides</i>	OBL	herb

Percentage of dominant species that are OBL, FACW, FAC+, or FAC: 100%

**Hydrophytic vegetation:** Yes: X No:

**Rationale:** More than 50% of the dominants are OBL, FACW, FAC+, or FAC.

### SOILS

Series and phase: Bonnie silt loam (Typic Fluvaquent)

On Perry County hydric soils list? Yes: X No:

Is the soil a histosol? Yes: No: X Histic epipedon present? Yes: No: X

Redox Concentrations? Yes: X No: Colors: 7.5YR 4/4 & 7.5YR 4/6

Redox Depletions? Yes: X No: Color: 10YR 6/2

Matrix color: 10YR 4/2

Other hydric soil indicators: None

**Hydric soils:** Yes: X No:

**Rationale:** The Natural Resources Conservation Service classifies Bonnie as having poorly drained conditions. The presence of redoximorphic features and a low chroma matrix are evidence of an environment saturated at a duration sufficient to promote extended periods of anaerobic conditions. Therefore, the soil meets the hydric soil criterion.

### HYDROLOGY

Inundated: Yes: No: X Depth of standing water: None

Depth to saturated soil: More than 0.6 m (24 in)

Overview of hydrologic flow through system: Precipitation and sheet flow contribute water to this site.

Flooding on Beaucoup Creek can sometimes reach the site, or at least affect water tables. Water leaves the site by evapotranspiration, sheet flow, and soil infiltration.

Size of watershed: Less than 2.6 km<sup>2</sup> (1.0 mi<sup>2</sup>) (647.5 km<sup>2</sup> (250 mi<sup>2</sup>) for Beaucoup Creek)

Other field evidence observed: This site is located along a drainageway. We observed drift lines, water-borne sediment deposits, and some bare areas that suggest prolonged ponding.

**Wetland hydrology:** Yes: X No:

**Rationale:** Landscape position and the evidence of prolonged ponding suggest that the site is inundated or saturated long enough during the growing season to meet the wetland hydrology criterion. This area is included in the area that meets the criterion from ISGS estimates as well.

**ROUTINE ONSITE WETLAND DETERMINATION**

Site 2 (page 2 of 4)

Field Investigators: Tessene, Kurylo, Draheim, and Zylka Date: 19 July 2006  
 Job No.: P99-102-90 Project Name: FAP 42 (IL 13/127) wetland mitigation site  
 State: Illinois County: Perry Applicant: IDOT District 9  
 Site name: Marsh  
 Legal Description: SW/4, SW/4, SW/4, Sec. 7, T.6S., R.2W.  
 Location: Along a drainageway extending from the road to the existing floodplain forest

**WETLAND DETERMINATION AND RATIONALE**

Is the site a wetland? Yes: X No:

**Rationale:** This site meets all three wetland criteria. The site is not included in the NWI.

Has the vegetation, soils, or hydrology been significantly disturbed? Yes: No: X

#### VEGETATION

<u>Dominant Plant Species</u>	<u>Indicator Status</u>	<u>Stratum</u>
1. <i>Agrostis alba</i>	FACW	herb
2. <i>Festuca pratensis</i>	FACU-	herb
3. <i>Juncus effusus</i>	OBL	herb

Percentage of dominant species that are OBL, FACW, FAC+, or FAC: 66.7%

**Hydrophytic vegetation:** Yes: X No:

**Rationale:** More than 50% of the dominants are OBL, FACW, FAC+, or FAC.

#### SOILS

Series and phase: Bonnie silt loam (Typic Fluvaquent)

On Perry County hydric soils list? Yes: X No:  
Is the soil a histosol? Yes: No: X Histic epipedon present? Yes: No: X  
Redox Concentrations? Yes: X No: Colors: 7.5YR 4/4 & 7.5YR 3/3  
Redox Depletions? Yes: No: X Color: N/A  
Matrix color: 10YR 3.5/2  
Other hydric soil indicators: None

**Hydric soils:** Yes: X No:

**Rationale:** The Natural Resources Conservation Service classifies Bonnie as having poorly drained conditions. The presence of abundant redoximorphic features and a low chroma matrix are evidence of an environment saturated at a duration sufficient to promote extended periods of anaerobic conditions. Therefore, the soil meets the hydric soil criterion.

#### HYDROLOGY

Inundated: Yes: No: X Depth of standing water: None  
Depth to saturated soil: More than 0.7 m (28 in)  
Overview of hydrologic flow through system: Precipitation, sheet flow, and groundwater flow contribute water to this site. Flooding on Beaucoup Creek can sometimes reach the site, or at least affect water tables. Water leaves the site by evapotranspiration, sheet flow, and soil infiltration.  
Size of watershed: Less than 2.6 km<sup>2</sup> (1.0 mi<sup>2</sup>) (647.5 km<sup>2</sup> (250 mi<sup>2</sup>) for Beaucoup Creek)  
Other field evidence observed: This site is located in a low area. We observed drift lines and wetland drainage patterns.

**Wetland hydrology:** Yes: X No:

**Rationale:** Landscape position and the evidence of flooding suggest that the site is inundated or saturated long enough during the growing season to meet the wetland hydrology criterion. This area is included in the area that meets the criterion from ISGS estimates as well.

**ROUTINE ONSITE WETLAND DETERMINATION**

Site 3 (page 2 of 6)

Field Investigators: Tessene, Kurylo, Draheim, and Zylka Date: 19 July 2006  
 Job No.: P99-102-90 Project Name: FAP 42 (IL 13/127) wetland mitigation site  
 State: Illinois County: Perry Applicant: IDOT District 9  
 Site name: Wet meadow (floodplain forest restoration)  
 Legal Description: NW/4, NW/4, NW/4, Sec. 18, T.6S., R.2W.  
 Location: Low, open area in southeastern part of site with planted trees; between the road and the existing floodplain forest

**WETLAND DETERMINATION AND RATIONALE**

**Is the site a wetland?** Yes: X No:

**Rationale:** This site meets all three wetland criteria. The site is not included in the NWI.

**SPECIES LIST**

Scientific name	Common name	Stratum	Wetland Indicator	C*	
<i>Acalypha rhomboidea</i>	three-seeded mercury	herb	FACU	0

## ROUTINE ONSITE WETLAND DETERMINATION

Site 4 (page 1 of 3)

Field Investigators: Tessene, Kurylo, Draheim, and Zylka Date: 19 July 2006  
Job No.: P99-102-90 Project Name: FAP 42 (IL 13/127) wetland mitigation site  
State: Illinois County: Perry Applicant: IDOT District 9  
Site name: Floodplain forest Legal Description: SW/4, SW/4, SW/4, Sec. 7, T.6S., R.2W.  
Location: Low area near the south end of the existing floodplain forest

Do normal environmental conditions exist at this site? Yes:  No:  
Has the vegetation, soils, or hydrology been significantly disturbed? Yes: No:

### VEGETATION

<u>Dominant Plant Species</u>	<u>Indicator Status</u>	<u>Stratum</u>
1. <i>Quercus palustris</i>	FACW	tree
2. <i>Ulmus americana</i>	FACW-	tree
3. <i>Aster ontarionus</i>	FAC	herb
4. <i>Elymus virginicus</i>	FACW-	herb

Percentage of dominant species that are OBL, FACW, FAC+, or FAC: 100%

**Hydrophytic vegetation:** Yes:  No:

**Rationale:** More than 50% of the dominants are OBL, FACW, FAC+, or FAC.

### SOILS

Series and phase: Bonnie silt loam (Typic Fluvaquent)

On Perry County hydric soils list? Yes:  No:  
Is the soil a histosol? Yes: No:  Histic epipedon present? Yes: No:   
Redox Concentrations? Yes:  No: Colors: 5YR 3/3 & 7.5 YR 4/6  
Redox Depletions? Yes: No:  Color: N/A  
Matrix color: 10YR 4/2 over 10YR 3/2

Other hydric soil indicators: None

**Hydric soils:** Yes:  No:

**Rationale:** The Natural Resources Conservation Service classifies Bonnie as having poorly drained conditions. The presence of redoximorphic features and a low chroma matrix are evidence of an anaerobic and saturated environment. Therefore, the soil meets the hydric soil criterion. This soil also meets the F3 hydric soil indicator from the NRCS.

### HYDROLOGY

Inundated: Yes: No:  Depth of standing water: None

Depth to saturated soil: More than 0.6 m (24 in)

Overview of hydrologic flow through system: Precipitation, sheet flow, groundwater flow, and flooding on an intermittent stream contribute water to this site. Flooding on Beaucoup Creek can sometimes reach the site, or at least affect water tables. Water leaves the site by evapotranspiration and slow soil infiltration.

Size of watershed: Less than 2.6 km<sup>2</sup> (1.0 mi<sup>2</sup>) (647.5 km<sup>2</sup> (250 mi<sup>2</sup>) for Beaucoup Creek)

Other field evidence observed: This site is located in a low area in the floodplain of a small stream. We observed drift lines, water-borne sediment deposits, wetland drainage patterns, and bare areas that suggest prolonged ponding.

**Wetland hydrology:** Yes:  No:

**Rationale:** Low landscape position and the evidence of flooding suggest that the site is inundated or saturated long enough during the growing season to meet the wetland hydrology criterion. This area is included in the area that meets the criterion from ISGS estimates as well.

**ROUTINE ONSITE WETLAND DETERMINATION**

Site 4 (page 2 of 3)

Field Investigators: Tessene, Kurylo, Draheim, and Zylka      Date: 19 July 2006  
 Job No.: P99-102-90      Project Name: FAP 42 (IL 13/127) wetland mitigation site  
 State: Illinois      County: Perry      Applicant: IDOT District 9  
 Site name: Floodplain forest  
 Legal Description: SW/4, SW/4, SW/4, Sec. 7, T.6S., R.2W.  
 Location: Low area near the south end of the existing floodplain forest

**WETLAND DETERMINATION AND RATIONALE**

**Is the site a wetland?** Yes: X No:

**Rationale:** This site meets all three wetland criteria. The site is not included in the NWI.

## ROUTINE ONSITE WETLAND DETERMINATION

Site 5 (page 1 of 3)

Field Investigators: Tessene, Kurylo, Draheim, and Zylka Date: 19 July 2006  
Job No.: P99-102-90 Project Name: FAP 42 (IL 13/127) wetland mitigation site  
State: Illinois County: Perry Applicant: IDOT District 9  
Site name: Floodplain forest  
Legal Description: SW/4, SW/4, SW/4, Sec. 7, T.6S., R.2W.  
Location: Southwestern part of the existing floodplain forest, directly east of IL 13/127

Do normal environmental conditions exist at this site? Yes: X No:  
Has the vegetation, soils, or hydrology been significantly disturbed? Yes: No: X

### VEGETATION

<u>Dominant Plant Species</u>	<u>Indicator Status</u>	<u>Stratum</u>
1. <i>Acer saccharinum</i>	FACW	tree
2. <i>Platanus occidentalis</i>	FACW	tree
3. <i>Aster lateriflorus</i>	FACW-	herb
4. <i>Cinna arundinacea</i>	FACW	herb

Percentage of dominant species that are OBL, FACW, FAC+, or FAC: 100%

**Hydrophytic vegetation:** Yes: X No:

**Rationale:** More than 50% of the dominants are OBL, FACW, FAC+, or FAC.

### SOILS

Series and phase: Bonnie silt loam (Typic Fluvaquent)

On Perry County hydric soils list? Yes: X No:

Is the soil a histosol? Yes: No: X Histic epipedon present? Yes: No: X

Redox Concentrations? Yes: X No: Colors: 7.5YR 4/3 & 7.5YR 4/4

Redox Depletions? Yes: No: X Color: N/A

Matrix color: 10YR 4/2

Other hydric soil indicators: None

**Hydric soils:** Yes: X No:

**Rationale:** The Natural Resources Conservation Service classifies Bonnie as having poorly drained conditions. The presence of redoximorphic features and a low chroma matrix are evidence of an anaerobic and saturated environment. Therefore, the soil meets the hydric soil criterion.

### HYDROLOGY

Inundated: Yes: No: X Depth of standing water: None

Depth to saturated soil: More than 0.6 m (24 in)

Overview of hydrologic flow through system: Precipitation, sheet flow, and flooding on an intermittent stream contribute water to this site. Flooding on Beaucoup Creek can sometimes reach the site, or at least affect water tables. Water leaves the site by evapotranspiration and slow soil infiltration.

Size of watershed: Less than 2.6 km<sup>2</sup> (1.0 mi<sup>2</sup>) (647.5 km<sup>2</sup> (250 mi<sup>2</sup>) for Beaucoup Creek)

Other field evidence observed: This site is located in a depression in the floodplain a small stream. We observed drift lines, water-borne sediment deposits, wetland drainage patterns, watermarks on trees, and bare areas that suggest prolonged ponding.

**ROUTINE ONSITE WETLAND DETERMINATION**

Site 5 (page 2 of 3)

Field Investigators: Tessene, Kurylo, Draheim, and Zylka Date: 19 July 2006  
 Job No.: P99-102-90 Project Name: FAP 42 (IL 13/127) wetland mitigation site  
 State: Illinois County: Perry Applicant: IDOT District 9  
 Site name: Floodplain forest  
 Legal Description: SW/4, SW/4, SW/4, Sec. 7, T.6S., R.2W.  
 Location: Southwestern part of the existing floodplain forest, directly east of IL 13/127

**Wetland hydrology:** Yes: X No:  
**Rationale:** Landscape position and the evidence of flooding suggest that the site is inundated or saturated long enough during the growing season to meet the wetland hydrology criterion. This area is included in the area that meets the criterion from ISGS estimates as well.

**WETLAND DETERMINATION AND RATIONALE**

**Is the site a wetland?** Yes: X No:  
**Rationale:** This site meets all three wetland criteria. The site is not included in the NWI.

**SPECIES LIST**

<b>Scientific name</b>	<b>Common name</b>	<b>Stratum</b>	<b>Wetland Indicator</b>	<b>C*</b>
<i>Acer negundo</i>	box elder	sapling, shrub	FACW-	1
<i>Acer saccharinum</i>	silver maple	tree, sapling, shr., herb	FACW	1
<i>Ambrosia trifida</i>	giant ragweed	herb	FAC+	0
<i>Asclepias incarnata</i>	swamp milkweed	herb	OBL	4
<i>Aster lateriflorus</i>	calico aster	herb	FACW-	2
<i>Aster ontarionis</i>	Ontario aster	herb	FAC	4
<i>Aster vimineus</i>	small white aster	herb	FACW-	3
<i>Boehmeria cylindrica</i>	false nettle	herb	OBL	3
<i>Carex annectens</i>	sedge	herb	FACW	3
<i>Carex aureolensis</i>	sedge	herb	OBL	4
<i>Carex blanda</i>	sedge	herb	FAC	2
<i>Carex conjuncta</i>	sedge	herb	FACW	5
<i>Carex granularis</i>	pale sedge	herb	FACW+	2
<i>Carex grayi</i>	bur sedge	herb	FACW+	6
<i>Carex lupulina</i>	hop sedge	herb	OBL	5
<i>Carex lurida</i>	bottlebrush sedge	herb	OBL	7
<i>Carex stipata</i>	sedge	herb	OBL	2
<i>Carex tribuloides</i>	sedge	herb	FACW+	3
<i>Celtis occidentalis</i>	hackberry	sapling, shrub	FAC-	3
<i>Cephalanthus occidentalis</i>	buttonbush	shrub	OBL	4
<i>Cinna arundinacea</i>	tall wood reed	herb	FACW	5
<i>Elymus virginicus</i>	Virginia wild rye	herb	FACW-	4
<i>Erigeron annuus</i>	daisy fleabane	herb	FAC-	1
<i>Eupatorium perfoliatum</i>	boneset	herb	FACW+	4
<i>Festuca pratensis</i>	tall fescue	herb	FACU-	**
<i>Fraxinus pennsylvanica</i>	green ash	tree, shrub	FACW	2
<i>Geum canadense</i>	white avens	herb	FAC	2
<i>Ipomoea lacunosa</i>	small morning glory	herb	FACW	1
<i>Juncus effusus</i>	soft rush	herb	OBL	4

\* Coefficient of Conservatism (see introduction)  
 (Species list concludes on next page)

\*\* Species not native to Illinois

**ROUTINE ONSITE WETLAND DETERMINATION**

Site 5 (page 3 of 3)

Field Investigators: Tessene, Kurylo, Draheim, and Zylka      Date: 19 July 2006  
 Job No.: P99-102-90      Project Name: FAP 42 (IL 13/127) wetland mitigation site  
 State: Illinois      County: Perry      Applicant: IDOT District 9  
 Site name: Floodplain forest  
 Legal Description: SW/4, SW/4, SW/4, Sec. 7, T.6S., R.2W.  
 Location: Southwestern part of the existing floodplain forest, directly east of IL 13/127

**SPECIES LIST (concluded)**

Scientific name	Common name	Stratum	Wetland Indicator	C*
<i>Lactuca floridana</i>	blue lettuce	herb	FAC-	4
<i>Leersia oryzoides</i>	rice cutgrass	herb	OBL	3
<i>Leersia virginica</i>	white grass	herb	FACW	4
<i>Lonicera maackii</i>	Amur honeysuckle	shrub	UPL	**
<i>Morus alba</i>	white mulberry	herb	FAC	**
<i>Phalaris arundinacea</i>	reed canary grass	herb	FACW+	**
<i>Phragmites australis</i>	common reed	herb	FACW+	1
<i>Pilea pumila</i>	clearweed	herb	FACW	3
<i>Platanus occidentalis</i>	sycamore	tree, sapling	FACW	3
<i>Polygonum punctatum</i>	dotted smartweed	herb	OBL	3
<i>Polygonum scandens</i>	climbing knotweed	herb	FAC	2
<i>Populus deltoides</i>	cottonwood	tree	FAC+	2
<i>Quercus palustris</i>	pin oak	sapling, shrub	FACW	4
<i>Sanicula gregaria</i>	black snakeroot	herb	FAC+	2
<i>Scirpus atrovirens</i>	green bulrush	herb	OBL	4
<i>Solanum carolinense</i>	horse nettle	herb	FACU-	0
<i>Toxicodendron radicans</i>	poison ivy	woody vine, herb	FAC+	1
<i>Ulmus americana</i>	American elm	tree, sapling	FACW-	5
<i>Viola pratincola</i>	common blue violet	herb	FAC	1

\* Coefficient of Conservatism (see introduction)  
 Mean c value =  $\sum C/N = 129/44 = 2.9$

\*\* Species not native to Illinois  
 $FQI = \bar{c} \sqrt{N} = \sum C/\sqrt{N} = 129/\sqrt{44} = 19.4$

## ROUTINE ONSITE WETLAND DETERMINATION

Site 6 (page 1 of 4)

Field Investigators: Tessene, Kurylo, Draheim, and Zylka Date: 19 July 2006  
Job No.: P99-102-90 Project Name: FAP 42 (IL 13/127) wetland mitigation site  
State: Illinois County: Perry Applicant: IDOT District 9  
Site name: Mesic floodplain forest  
Legal Description: SW/4, SW/4, SW/4, Sec. 7 and NW/4, NW/4, NW/4, Sec. 18, T.6S., R.2W.  
Location: Most of the existing floodplain forest north of Pyatts, directly east of IL 13/127

Do normal environmental conditions exist at this site? Yes: X No:  
Has the vegetation, soils, or hydrology been significantly disturbed? Yes: No: X

### VEGETATION

<u>Dominant Plant Species</u>	<u>Indicator Status</u>	<u>Stratum</u>
1. <i>Quercus palustris</i>	FACW	tree
2. <i>Ulmus americana</i>	FACW-	tree
3. <i>Lonicera japonica</i>	FACU	woody vine
4. <i>Eupatorium rugosum</i>	FACU	herb
5. <i>Viola pratincola</i>	FAC	herb

Percentage of dominant species that are OBL, FACW, FAC+, or FAC: 60%

**Hydrophytic vegetation:** Yes: X No:

**Rationale:** More than 50% of the dominants are OBL, FACW, FAC+, or FAC.

### SOILS

Series and phase: Bonnie silt loam (Typic Fluvaquent)

On Perry County hydric soils list? Yes: X No:

Is the soil a histosol? Yes: No: X Histic epipedon present? Yes: No: X

Redox Concentrations? Yes: X No: Color: 7.5YR 3/4 & 3/3

Redox Depletions? Yes: No: X Color: N/A

Matrix color: 10YR 3/2

Other hydric soil indicators: None

**Hydric soils:** Yes: X No:

**Rationale:** The Natural Resources Conservation Service classifies Bonnie as having poorly drained conditions. The presence of redoximorphic features and a low chroma matrix are evidence of an environment saturated at a duration sufficient to promote extended periods of anaerobic conditions. Therefore, the soil meets the hydric soil criterion. This site seems to be an exception this year compared to other years when this area did not contain redoximorphic features nor a matrix color sufficient to be hydric.

### HYDROLOGY

Inundated: Yes: No: X Depth of standing water: None

Depth to saturated soil: More than 0.6 m (24 in)

Overview of hydrologic flow through system: Precipitation, sheet flow, and flooding on an intermittent stream contribute water to this site. Flooding on Beaucoup Creek can sometimes reach the site, or at least affect water tables. Water leaves the site by evapotranspiration and soil infiltration.

Size of watershed: Less than 2.6 km<sup>2</sup> (1.0 mi<sup>2</sup>) (647.5 km<sup>2</sup> (250 mi<sup>2</sup>) for Beaucoup Creek)

Other field evidence observed: This site is located along a small stream. We observed some drift lines.

**ROUTINE ONSITE WETLAND DETERMINATION**

Site 6 (page 2 of 4)

Field Investigators: Tessene, Kurylo, Draheim, and Zylka Date: 19 July 2006  
 Job No.: P99-102-90 Project Name: FAP 42 (IL 13/127) wetland mitigation site  
 State: Illinois County: Perry Applicant: IDOT District 9  
 Site name: Mesic floodplain forest  
 Legal Description: SW/4, SW/4, SW/4, Sec. 7 and NW/4, NW/4, NW/4, Sec. 18, T.6S., R.2W.  
 Location: Most of the existing floodplain forest north of Pyatts, directly east of IL 13/127

**Wetland hydrology:** Yes: No: X

**Rationale:** This site is at a slightly higher elevation than Sites 4 and 5 and lacks enough evidence of flooding to suggest that the site is inundated or saturated long enough during the growing season to meet the wetland hydrology criterion. This site is not included in the area considered by the ISGS to have wetland hydrology.

**WETLAND DETERMINATION AND RATIONALE**

**Is the site a wetland?** Yes: No: Undetermined: X

**Rationale:** Although dominant hydrophytic vegetation is present and hydric soils may also have developed, there is no clear evidence of wetland hydrology, or that site conditions had changed since last year. The site is not included in the NWI.

**SPECIES LIST**

Scientific name	Common name	Stratum	Wetland Indicator	C*
<i>Acalypha rhomboidea</i>	three-seeded mercury	herb	FACU	0
<i>Acer negundo</i>	box elder	tree, shrub	FACW-	1
<i>Acer saccharinum</i>	silver maple	tree, shrub	FACW	1
<i>Allium canadense</i>	wild garlic	herb	FACU	2
<i>Allium vineale</i>	field garlic	herb	FACU	**
