

# Slope Sled

## Day Labor Problem:

Many projects require workers to move heavy materials and tools up slope walls. Because these items may weigh hundreds of pounds, this can cause a safety hazard for workers.

## Solution:

A lightweight, portable sled was created to move heavy rockers, materials and tools. When used with a winch, the slope sled provides a safe method for moving these items to their destinations safely.

Build time for the sled is approximately 2-3 hours.

The sled was created using easily obtained materials, including pieces leftover from other projects.

A power winch easily gets the sled where it needs to go.
